

VIRTUAL MULTISLICE COMPUTED TOMOGRAPHY CYSTOSCOPY

Essay

**Submitted for partial fulfillment of Master Degree
In Radiodiagnosis**

Presented by

Mohamed Ahmed Ahmed Shendy

M.B.B.Ch

Faculty of medicine

Beni Suef – Cairo University

Supervised by

Prof. Dr. Niviene Mostafa

Professor of Radiodiagnosis

Faculty of Medicine - Ain Shams University

Dr. Samir Foad Abdel Ghafar

Lecturer of Radiodiagnosis

Faculty of Medicine - Ain Shams University

Faculty of Medicine

Ain Shams University

٢٠٠٧

Acknowledgement

First and for most, thanks to God who have lightened my path to become a humble student of a noble profession, and granted me the ability to accomplish this work.

*I would like to express my sincere feelings of appreciation and admiration to **Dr. Niviene Mostafa** , Professor of Radiodiagnosis, Faculty of Medicine, Ain Shams University, for her tremendous support that helped me through this work. I am deeply grateful for her more than words can ever express.*

*I would like to express my deep feelings of gratitude to **Dr. Samir Foad Abdel Ghafar**, Lecturer of Radiodiagnosis, Faculty of Medicine, Ain Shams University for his valuable supply of literature, indescribable support and meticulous revision of this work.*

I would like to express my feelings of gratitude and appreciation to my mother for being enlightening, inspiring, loving and patient in both my professional and personal lives.

Finally yet importantly, I would like to express my gratitude to my father and my family for their love and support and for every one who participated in some way to let this work come to such final picture, I owe my thanks and gratitude.

منظار المثانة الافتراضي بالأشعة المقطعية متعددة الكواشف

رسالة مقدمة من

الطبيب/ محمد أحمد أحمد شندى
بكالوريوس الطب و الجراحة
كلية الطب
جامعة القاهرة- فرع بنى سويف

توطئة للحصول على درجة الماجستير فى الأشعة التشخيصية

تحت إشراف

أ.د/ نيقين مصطفى

أستاذ الأشعة التشخيصية
كلية الطب- جامعة عين شمس

د/ سمير فؤاد عبد الغفار

مدرس الأشعة التشخيصية
كلية الطب- جامعة عين شمس

كلية الطب
جامعة عين شمس

Introduction and aim of work

Virtual CT cystoscopy is a promising technique to be used in the detection of bladder lesions. In the future, it may be possible or even advantageous to incorporate it into the imaging algorithm for evaluation of bladder lesion⁽¹⁾.

Multidetector row CT is the most recent advance in CT technology. An increased number of detector rows and more powerful x-ray tubes result in faster scanning time, increased volume coverage, and improved spatial and temporal resolution. MDCT (multidetector computed tomography) technology allows superior image quality, decreased examination time, and the ability to perform complex multiphase vascular and three-dimensional examinations⁽¹⁾.

The introduction of (MDCT) with the possibility of acquiring isotropic datasets has been an ideal prerequisite for development of virtual MDCT cystoscopy. Remarkable technical progress regarding post-processing of high-resolution 3D datasets as well as a considerable reduction of the time required for post-processing made it possible to introduce virtual MDCT cystoscopy into the clinical routine. 3D post-

processing that often required 15–20 h when virtual endoscopy techniques were first developed can now be performed in less than 10 min after transfer of data to the 3D workstation. With the limitations and contraindications of conventional cystoscopy in mind, virtual MDCT cystoscopy may be seen as a valuable alternative to conventional cystoscopy for evaluation of hematuria⁽⁷⁾.

As virtual MDCT cystoscopy is an expensive technique so it is not used in all urinary bladder lesions, as most lesions are diagnosed by ordinary techniques as excretory urography, ultrasound and computed tomography in various combinations (as stones, urinary tract infection, congenital anomalies and most of tumors). The role of virtual MDCT cystoscopy appears in cases of negative ordinary tools as it has high sensitivity in detection of most diseases⁽⁷⁾.

Aim of work:

To assess the usefulness of virtual cystoscopy performed with multidetector computed tomography in patients with different urinary bladder pathologies.

Anatomic Relationships

The *urinary bladder* (figure 1,2) is a musculomembranous sac which acts as a reservoir for the urine; and as its size, position, and relations vary according to the amount of fluid it contains, In both conditions the position of the bladder varies with the condition of the rectum, being pushed upward and forward when the rectum is distended⁽⁴⁾.

(**Figure 1**): Median sagittal section of male pelvis⁽⁹⁾.
