

# **Neoadjuvant chemotherapy for breast Cancer: evaluation by PET / CT**

**Thesis**

**Submitted for partial fulfillment of master degree in radiology**

**By**

**Samar Ibrahim Mohamed**

**M.B.B.CH**

**Under supervision of**

**Prof. Dr. Rania Ali Maarouf**

Professor of Diagnostic Radiology

Department: Radiology department, Faculty of Medicine,

Ain Shams University

**Dr. Amgad S. Abdel-Rahman**

Lecturer of Diagnostic Radiology

Department: Radiology department, Faculty of Medicine,

Ain Shams University

**Faculty of Medicine, Ain Shams University**

**(2020)**

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قالوا

لسبب انك لا تعلم لنا  
إلّا ما علمتنا إنك أنت  
العليم العظيم

صدقة الله العظيم

سورة البقرة الآية: ٣٢

# Acknowledgements

*First of all, all gratitude is due to **Allah** almighty for blessing this work, until it has reached its end, as a part of his generous help, throughout my life.*

*Really I can hardly find the words to express my gratitude **Prof. Dr. Rania Ali Maarouf** Professor of Diagnostic Radiology Department Faculty of Medicine, Ain Shams University, for her supervision, continuous help, encouragement throughout this work, and tremendous effort she has done in the meticulous revision of the whole work. It is a great honor to work under her guidance and supervision.*

*I would like also to express my sincere appreciation and gratitude to **Dr. Amgad S. Abdel-Rahman**, Lecturer of Diagnostic Radiology department, Faculty of Medicine, Ain Shams University for his continuous directions and support throughout the whole work.*

***Samar Ibrahim Mohamed***

## INTRODUCTION

**B**reast cancer is the most commonly occurring cancer in women and the second most common cancer overall. There were over 2 million new cases in 2018 (*Bray Fet al., 2018*).

Treatment of breast cancer includes locoregional resection, with or without radiotherapy as well as systemic therapies such as chemotherapy, endocrine therapy, biological targeting agents, and a combination of the above (*Peart, 2015*).

Neoadjuvant therapy (NAT), which corresponds to the administration of systemic anticancer agents prior to local treatment, has been recommended as a general approach in locally advanced-stage diseases (*Kaufmann et al., 2012*).

The advantages of NAT for breast cancer include decreasing the tumor size, improving outcomes of radical or more conservative surgical interventions and early evaluation of clinical efficacy (*Rubovszky and Horváth, 2017*).

Positron emission tomography (PET)-CT scans have recently gained popularity as an effective functional diagnostic imaging method in the clinical management of breast cancer (*Inokuchi et al., 2009*).
