**MONA MAGHRABY**

**Ain Shams University  
Faculty of Medicine  
General Surgery Department**

**Comparing pre-operative fine needle aspiration cytology to paraffin section post-operative for solitary thyroid nodule**

*Submitted for Fulfillment of Master Degree  
in General Surgery*

*By*

**Mahmoud Reda Antar Mohamed**

M.B.B.Ch

General Surgery Resident

General Organization Of Teaching Hospitals and Institutes

*Under supervision of*

*Prof. Dr.*

**Emad Eldin Farid Ebrahim**

Professor of General Surgery

Faculty of Medicine

Ain Shams University

*Prof. Dr.*

**Hoda Hassan Abou Gabal**

Associate Professor of Pathology

Faculty of Medicine

Ain Shams University

*Dr.*

**Mohamed Mahmoud El-Matary**

Lecturer of General Surgery

Faculty of Medicine

Ain Shams University

*Dr.*

**Ehab Mohammed Ali Fadl**

Lecturer of General Surgery

Faculty of Medicine

Ain Shams University

2021

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

فَالرُّسُلُ بِحُجَّتِكَ لِأَعْلَامِنَا الْإِمَامِ عَلَيْنَا  
إِنَّا نَبَتْ الْعِلْمِ الْحَكِيمِ

صِدْقِ اللَّهِ الْعَظِيمِ

## *Acknowledgment*

*Thanks first and last to **ALLAH**, the real support and the guidance in every step in our life.*

*I would like to express my sincere gratitude and deepest appreciation to **Prof. Dr. Emad Eldin Farid Ebrahim**, "Professor of General Surgery, Faculty of Medicine, Ain Shams University". He patiently gave me much of his time, experience, Kindness, knowledge, directions, supervision and support throughout this work that cannot be expressed by words.*

*I wish to extend my deep thanks and appreciation to*

**Prof. Dr. Hoda Hassan Abou Gabal**, "Assistant Professor of Pathology, Faculty of Medicine, Ain Shams University". For her kind supervision, encouragement and valuable advices which were one of the major causes that helped me to finish this work,

*I owe special gratefulness and much regards to*

**Dr. Mohammad Mahmoud El-Matary**, "Lecturer of General Surgery, Faculty of Medicine, Ain Shams University". For giving me the privilege of supervising this thesis, with his directions which helped me to set my foot on the right track, and made the completion of this work possible.

*I also want to express my deep grateful thanks to*

**Dr. Ehab Mohammad Ali Fadl**, "Lecturer of General Surgery, Faculty of Medicine, Ain Shams University". To whom I owe more than words to express His limitless help, valuable advice and kind encouragement were beyond acknowledgments.

*Dr. Mahmoud Reda Antar Mohamed*

# Introduction

Solitary thyroid nodule (STN) is a single swelling in the thyroid tissue that is radiologically remarkable from the rest of thyroid parenchyma (*Haugen et al., 2016*). STN is found either by self-examination by the patient, during a clinical assessment by the clinician or incidentally discovered on radiological procedures (*Davies et al., 2014*).

Thyroid nodules are common; they are more frequent in females than males and their prevalence increases with age and body mass index (*Fisher et al., 2018*).

Clinically palpable nodules are experienced in about 8% of the adult population, with the utilization of imaging procedures specially ultrasound; the possibility of recognition of thyroid nodules has significantly increased (*Tai et al., 2012*).

The prevalence of thyroid malignancy is low; being just about 1%. However, it was reported that the rate of thyroid cancer is expanding over the years. Thyroid malignancy occurs in about 5% of all thyroid nodules irrelevant of their size (*Yeung et al., 2008, Unnikrishnan et al., 2011*).

The possibility of malignancy is more in cases with STN compared to those with multi-nodular goiter (*Gupta et al., 2010, Iqbal et al., 2010*). Thyroid nodules are of a specific concern when they are found in cases less than 20 years old as it has more risk of malignancy in such young age group (*Carling et al., 2014*).

The pre-operative assessment of thyroid nodules is crucial to differentiate between benign and malignant nodules. It also assists to avoid unnecessary surgical procedures and subsequent possible complications such as hypothyroidism, parathyroid or laryngeal nerves injury (*Tai et al., 2012*).

FNAC is the gold standard technique in the assessment of thyroid nodules; it is described as quick, reliable, cost effective and minimally invasive. One of the significant points of interest is that FNAC could be done as an out-patient procedure. According to many studies it has led to significant decrease in surgical procedures of the patients with thyroid nodules; however it shares to an increase in percentage of thyroid surgeries with malignant lesions (*Yassa et al. 2007*).

FNAC, especially ultrasound guided is very safe diagnostic procedure in the management of thyroid nodules. Post FNAC local pain and minor hematoma are the most common complications, while serious complications seem to be rare (*Polyzos et al., 2009*).

The success of FNAC depends on several factors such as aspirator experience, skillful cytological interpretation and rational analysis of cytological and clinical data. Still the histopathological examination of the thyroid gland is considered as superior to FNAC in diagnosing the thyroid pathologies due to certain pitfalls in FNAC such as scanty sample, vascularity of thyroid swelling variation in sampling technique and inability to differentiate between follicular adenoma from follicular carcinoma, beside the possibility of false negative and false positive (*Roy et al., 2019, Shere et al., 2013*).
