

Recent Trends in Management of Blunt Abdominal Trauma

Essay

**Submitted for Partial Fulfillment of Master Degree
in General Surgery**

By

AHMED MOHAMED ELSAEED
M.B. B.Ch.

Supervised by

Professor / MOUSTAFA ADLY

*Professor of General Surgery; Faculty of Medicine;
Ain Shams University*

Doctor General / YOUSSEF ABDEL MESSIH

*Consultant Surgeon; Head of General Surgery Dept.
El Galaa Family Hospital (A.F)*

Doctor / MOHAMED AAMER

*Assistant prof. of General Surgery;
Faculty of Medicine ;Ain ShamsUniversity*

**Faculty of Medicine
AinShamsUniversity**

Dedication

*To the soul of Professor dr./ MOUSTAFA
ADLY,,*

To my dear father and mother,,,,,

LIST OF CONTENTS

١. Introduction & Aim of the work.....	١
٢. Mechanisms and patterns of blunt abdominal injury.....	٣
٣. Pathophysiology of blunt abdominal trauma.....	١٢
٤. Diagnosis of blunt abdominal trauma:.....	٢٢
a) Clinical assessment.....	٢٥
b) Investigations.....	٣٢
٥. Strategies for management:.....	٥٧
a) Initial management.....	٥٨
b) Management of specific abdominal injuries:	
• Hepatic injury.....	٧٠
• Splenic injury.....	٧٩
• Kidney injury.....	٨٧
• Stomach injury.....	٩٣
• Duodenal injuries.....	٩٨
• Small Intestinal injury.....	١٠٠
• Colon injuries.....	١٠٣
• Pancreatic injury.....	١٠٥
• Retroperitoneal hematoma.....	١٠٧
• Vascular abdominal injury.....	١٠٩
• Diaphragmatic injuries.....	١١١
• Urinary bladder injuries.....	١١٦
٦. Summary & conclusion.....	١١٨
٧. References.....	١٢٢
٨. Arabic summary.	

LIST OF TABLES

Table No.	Title	Page
١.	Types of injuries	٤
٢.	Frequency and incidence of organ injury.....	٦
٣.	Sub-classification of blunt trauma.....	١٥
٤.	Glasgow Coma Scale	٢٦
٥.	Trauma Score	٢٧
٦.	Glasgow Coma Scales for adults and infants	٦١
٧.	Liver injury scale (١٩٩٤ revision).....	٧٠
٨.	Spleen injury scale (١٩٩٤ revision).....	٧٩
٩.	Kidney injury scale scale.....	٨٧
١٠.	Stomach injury scale	٩٣
١١.	Duodenal injury scale.....	٩٦
١٢.	Small bowel injury scale.....	١٠٠
١٣.	Colon injury scale.....	١٠٣
١٤.	Pancreas injury scale.....	١٠٥
١٥.	Abdominal Vascular Injury.....	١٠٧, ١٠٨
١٦.	Diaphragm injury scale.....	١١٢
١٧.	Urinary bladder injury scale.....	١١٧

LIST OF FIGURES

Figure No.	Title	Page

٢.	Liver injury	٨
٣.	Small bowel injury	١٠
٤.	Focused abdominal sonography for trauma (FAST). Schematic drawing illustrating the standard four-view FAST	٣٩
٥.	Patterns of free fluid	٤٠
٦.	a)Sagittal ultrasound image of liver, kidney, and diaphragm yields normal findings. (b) Sagittal ultrasound image of right upper quadrant shows blood between liver and kidney and between liver and diaphragm	٤١
٧.	The semi-open technique for peritoneal lavage	٤٨
٨.	Screen display from different steps of the simulation	٤٩
٩.	Algorithm for laparoscopy in blunt abdominal trauma	٥٢
١٠.	a.Trocar site in laparoscopic examination for suspected blunt bowel injury. A, A ١٠-mm trocar (laparoscope); B, a ٥-mm trocar; C, a ٥-mm trocar. b. Laparoscopic observation of small bowel. A, Lifting up the bowel with the two bowel forceps. B, Turning over the bowel	٥٣

١١.	Algorithm for the assessment of the patient with blunt abdominal trauma.	٥٦
١٢.	(a) Manual compression of large hepatic injuries temporarily controls blood loss in hypovolemic patients until the circulating blood volume can be restored (B) The Pringle maneuver controls arterial and portal vein haemorrhage from the liver. Any haemorrhage that continues must come from the hepatic veins (C) Perihepatic packing is often effective in managing extensive parenchymal injuries. It has also been successfully employed for grade V juxtahepatic venous injuries	٧٥
١٣.	Hepatotomy with selective ligation is an important technique for controlling haemorrhage from deep (usually penetrating) lacerations. This technique includes finger fracture to extend the length and depth of the wound until vessels or ducts are encountered and controlled	٧٧
١٤.	Splenic repair. A: The mobilized spleen in the operative field. B: Horizontal mattress sutures with pledgets for splenic repair	٨٣
١٥.	(a) The first step in mobilizing the spleen is to make an incision in the peritoneum and the endoabdominal fascia, beginning at the inferior pole and continuing posteriorly and superiorly. (b) The correct plane of dissection is between the pancreas and Gerota's fascia	٨٥

١٦.	The steps in renal reconstruction	٩١
١٧.	A) Duodenal haematoma grade ١ B) Side-to-side duodenojejunostomy	٩٧
١٨.	Cattel's maneuver	٩٨
١٩.	Pyloric exclusion procedure.	٩٩

Acknowledgement

First of all, I would like to raise my deepest thanks to **Allah**, the most kind and the most merciful, for helping me to accomplish this work.

I would like to express my deepest thanks and supreme gratitude to **Professor Dr. / MOUSTAFA ADLY** (GOD bless his soul) Professor of General Surgery Faculty of Medicine, Ain Shams University for his close supervision, valuable instructions, generous flow of support and constructive remarks throughout the preparation of this essay.

Also, I am very grateful to **Doctor General / YOUSSEF ABDEL MESSIH** Consultant Surgeon; Head of General Surgery Dept. El Galaa Family Hospital (A.F) for his kind assistance, helpful advices and great supports during the progress of this work.

And,,,I would like to express my sincere and deep gratitude to my **Prof. Dr./MOHAMED AAMER** Assistant prof. of General Surgery; Faculty of Medicine ;Ain Shams University, for his valuable help, constructive criticism and keen interest in the progress and accomplishment of this work.

Introduction

Trauma is the leading cause of death in people under age of 40 years, and 10% of deaths result from abdominal injury which may be blunt in 84% of cases or penetrating in 16%. Early detection of these life threatening injuries is the most important factor in decreasing incidence of death due to intra-abdominal trauma. (Soynucu et al., 2007).

Blunt abdominal injury is caused by one or combination of the following forces:-Direct impact, acceleration deceleration injuries, rotational and shear forces. All these mechanisms depend on the mode of energy transfer. Penetrating abdominal trauma is commonly caused by gun shots or penetration of abdominal wall by sharp objects. (Truneky, 1992).

The most commonly injured organs are: spleen, liver, kidneys, small bowel, colorectum, diaphragm, urinary bladder and pancreas. (Udeani et al., 2008).

Assessment of the abdomen for possible intra-abdominal injury due to trauma is a common clinical challenge for surgeons and emergency physicians. (McKenney, et al, 1996).

A variety of tests are used to evaluate abdominal injury include: clinical examination, abdominal ultrasonography, computed tomography and diagnostic peritoneal lavage. (Miller et al., 2003).

Laparoscopy has been applied safely and effectively as a screening tool in stable patients with blunt abdominal trauma. (Macho et al., ٢٠٠٣).

Failure to recognize occult abdominal hemorrhage and to successfully control bleeding from intra-abdominal organs leads to significant morbidity and such injuries account for ١٠% of traumatic deaths. (Hoyt et al., ٢٠٠٢)

Traditional philosophy regarding blunt abdominal trauma has adhered to the idea that visceral injuries are best treated by surgical management in the past ٢٠ years that approximately ٢٥% of all trauma victims require abdominal exploration; however there has been a re-evaluation in thought with progressively increasing use of selective non operative management. (Shapiro et al., ٢٠٠١).

AIM OF THE WORK

This work aims to discuss the recent trends in the management of abdominal trauma in order to improve the prognosis and decrease morbidity and mortality.

Chapter ()

Mechanisms & patterns of blunt abdominal trauma

Epidemiology of BAT

Trauma is the leading cause of death in people under the age of 40 years, and 10% of these deaths result from abdominal injury which may be blunt or penetrating. Early detection of these life-threatening injuries is the most important factor in decreasing the incidence of death due to intra-abdominal trauma. Blunt abdominal trauma is mostly due to road traffic accidents, falls, accidents at work, or sporting misadventures. (Schweizer et al., 2001).

Table (1) :Types of injuries

Type of Injury	Frequency	Percent
Penetrating	645	35.7%
Blast	425	23.5%
Blunt	410	22.7%
Unknown	84	4.6%
Crush	63	3.5%
Mechanical	49	2.7%
Thermal	48	2.7%
Undetermined	21	1.2%
Other	16	0.9%
Chemical agent	10	0.6%
Bites/Stings	8	0.4%
Degloving	8	0.4%
Electrical	7	0.4%
Heat Injury	7	0.4%
Inhalation	3	0.2%
Multiple Penetration System	3	0.2%
Total	1807	100%

(Gonzalez et al., 2000)

Abdominal injury is a contributing factor in ۲۰% of trauma deaths, either early from exsanguinating hemorrhage or late from bowel injury, subsequent sepsis or multiple organ failure. **(Bickell et al., ۱۹۹۴).**

Blunt trauma to abdomen can cause severe injury especially to solid abdominal organs. **(Hann et al., ۲۰۰۵).**

The diagnosis of hollow viscus injury remains a challenge in abdominal trauma patients. **(Fakhry et al., ۲۰۰۳).**

The male to female ratio is ۴:۶ according to national and international data. **(Salomone, et al., ۲۰۰۹)**

Assessment of the abdomen for possible intra-abdominal injury due to trauma is a common clinical challenge for surgeons and emergency medicine physicians. Physical findings may be unreliable because of altered patient consciousness, neurological deficit associated with head injury or spinal injury, medication, or other associated injuries **(McKenney et al., ۱۹۹۶).**

Haemodynamically unstable patient need diagnostic peritoneal lavage (DPL) and Ultrasound (US) to determine haemoperitoneum. While in stable patients CT could be added **(Barlon et al., ۱۹۹۶).**

The diagnostic peritoneal lavage proved to be a very sensitive test for intra-abdominal bleeding **(Yeo, ۲۰۰۴).**
