Title of Thesis:

Modeling of Chromium Removal from Tannery Wastewater using Bagasse

Key Words:

Tannery waste, Chromium removal, Bagasse waste, Adsorption, Wastewater.

Summary:

The objective of this study is the removal of chromium ions from tannery wastewater using bagasse as adsorbent. The batch kinetic studies indicated that the use of bagasse as adsorbent is an effective tool to remove around 70% of chromium from tannery wastewater after 2 hours and that the best pH was 6. The equilibrium data based on correlation coefficients could be best explained by the Langmuir, Freundlich, Temkin and Dubinin–Radushkevich isotherm. The Langmuir isotherm was found to describe the best adsorption isotherm in comparison with other isotherm. The kinetic data obtained have been analyzed using pseudo-first-order and pseudo-second-order models. The best fitted kinetic model was found to be pseudo-second-order model.

The results revealed that waste bagasse may efficiently be used for the removal of chromium from tannery wastewater effluents with pH around 6, weight ratio 10 g/l, using agitation rate 250 rpm at 75°C.

ACKNOWLEDGEMENT

First and above all, I praise God, the almighty for providing me this opportunity and granting me the capability to proceed successfully. This thesis appears in its current form due to the assistance and guidance of several people. I would therefore like to offer my sincere thanks to all of them.

Prof. Dr. Shakinaz El-Sheltawy, my academic advisor, my cordial thanks for accepting me as a MSc student, your warm encouragement, thoughtful guidance, critical comments, supporting my attendance at various conferences and correction of the thesis.

I want to express my deep thanks to my supervisor **Prof. Dr. Maha El-Shafei**, for the trust, the insightful discussion, offering valuable advice, for your support during the whole period of the study.

I extend my sincere thanks and high appreciation to **Dr. Khaled Zaher**, for his great attention.

I thank profusely all the staffs of Chemical Engineering Laboratory in Chemical Engineering Department, Faculty of Engineering , Cairo University and in Tabbin Institute for Metallurgical Studies for their kind help and co-operation throughout my study period.

I am extremely thankful to my friend **Eng. Rabie Elagayza**, Department of Chemical Engineer, Cairo University for providing me necessary technical suggestions during my research pursuit.

Finally, working on this thesis was a very difficult experience; I would not be able to complete this thesis without the love and support of my husband **Eng. Mohamed Moharam**. Thanks a million to my Parents for their encouragement help and support.

ABSTRACT

The presence of heavy metals in the wastewater is wide spreading all over the world. In Egypt, industrial wastewater is considered the main source of pollution that leads to serious environmental problems which have reached 50000-70000 m³/year and from which tannery waste represents the most toxic streams with its chromium content. Agriculture wastes are being used also to eliminate heavy metals from wastewater through adsorption processes.

The present study evaluate the effect of different engineering parameters to develop a dual solution for environmental pollution by the uptake of chromium from chromium contaminated tannery wastewater using waste bagasse produced from sugarcane industry as adsorbent.

Removal of chromium ions from tannery wastewater was studied on both acidic and alkaline ranges of pH (2, 4, 6 and 8) with contact time (5, 15, 40, 80 and 120 min), bagasse to wastewater ratio (1, 2, 4, 8 and 10 g/l), using an agitation rate of (50, 150 and 250 rpm) at temperature, T, (30, 50 and 75°C) as main operation conditions.

The batch kinetic studies indicated that the use of bagasse as adsorbent is an effective tool to remove around 70% of chromium after 2 hours and that the best pH was 6. The equilibrium data based on correlation coefficients could be best explained by the Langmuir, Freundlich, Temkin and Dubinin–Radushkevich isotherm. The Langmuir isotherm was found to describe the best adsorption isotherm in comparison with other isotherm. The kinetic data obtained have been analyzed using pseudo-first-order and pseudo-second-order models. The best fitted kinetic model was found to be pseudo-second-order model.

The results revealed that waste bagasse may efficiently be used for the removal of chromium from tannery wastewater effluents with pH around 6, weight ratio 10 g/l, using agitation rate 250 rpm at 75°C.
