STATEMENT

This Thesis is submitted to Ain Shams University in partial fulfillment of the requirements of M.Sc. degree in Electrical Engineering.

The included work in this thesis has been carried out by the author at the department of electrical power and machines, Ain Shams University. No part of this thesis has been submitted for a degree or a qualification at any other university or institution.

Name: Mostafa Gehad Mohamed Attia

Signature:

Date: / / 2015

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to **Professor. Dr. Hossam El Din Abd Allah Talaat** for the continuous support of my study and research, for his patience, motivation, immense knowledge , and teaching me how to think. His guidance helped me in all the time of research and writing of this thesis.

I wish to express my deep thanks to **Dr. Mohamed Abd El Aziz Hassan Abd El Rahman** for his supervision, supporting, helpful advice, continuous guidance, theoretical advice, fruitful criticism and encouragement during the work.

I wish to express my deep thanks to **Dr. Mohamed Ezzat Abd El Rahman** for his continuous guidance, support, undeniable technical information, critical advice and assistances during the stages of preparation of this work.

I wish to express my deepest gratitude to the soul of **Professor. Dr Mohamed Mohamed Mansour** for giving me the opportunity to work under his supervision, for sharing his incomparably profound knowledge with me, for deepening my understanding and helping me a lot at the beginning of this work.

Finally, I am grateful for my parents and my sister, who helped me throughout all of this work. Thank you for supporting me in every way.

Mostafa Gehad Mohamed Attia

ABSTRACT

Railways are a safe land transport system when compared to other forms of transport. Power is provided to locomotives which either draw electrical power from a railway electrification system or produce their own power, usually by diesel engines.

For electrified railways; Power is transmitted to electric railway locomotives using DC or single phase AC networks. For AC electrified railways it is important to ensure a reliable and secure power supply to the traction system, therefore a suitable protection system is required. The protection system shall distinguish between the fault current and the train load current, and isolate the fault as soon as possible.

This thesis presents the modeling and simulation of a 25 kV 50 Hz AC traction system using Power System Block set (PSB) / SIMULINK software package. The model has been used to study different simulation cases considering the common types of faults.

A proposed distance relay algorithm is introduced. The performance of the proposed distance relay is checked in case of earth faults (normal and emergency feeding conditions), wrong phase coupling, and resistive faults. Furthermore, the proposed relay algorithm has a fault location function to detect the faulty subsection. The performance of fault location function is checked. Finally the proposed relay settings is selected to compromise between security requirements and sensitivity of fault detection to meet the operational requirements

The thesis consists of five chapters

Chapter (1): Gives an introduction of the railway systems and electrification systems.

Chapter (2): Introduces a literature survey for protection systems and material helpful for understanding the problem AC feeding system protection for electrified railways.

Chapter (3): Introduces the modeling methodology of the proposed distance relay algorithm.

Chapter (4): Introduces simulation and results for the proposed distance relay algorithm.

Chapter (5): Presents the extracted conclusions and future work suggestions.

ABSTRACT	vi
TABLE OF CONTENTS	viii
LIST OF TABLES	xi
LIST OF FIGURES	xii
LIST OF ABBREVIATIONS	xv

1. INTRODUCTION 1-24

1.1 Background of railway systems	1
1.2 Electrification systems	2
1.2.1 DC – Power supply system	5
1.2.1.1 Structure of DC system	5
1.2.1.2 Positions of traction substations	7
1.2.1.3 DC feeding system protection	7
1.2.2 AC – Power supply system	8
1.2.2.1 Structure of AC feeding system	9
1.2.2.2 AC Power feeding system configurations	12
1.3 Contact systems	16
1.3.1 Catenary system	16
1.3.2 Third rail	18
1.4 Traction motors	19
1.4.1 Electric traction machines	19
1.4.2 Traction motors types	20
1.4.2.1 DC series motor	21
1.4.2.2 AC motors	22
1.5 Thesis objective and aim of research	22
1.6 Thesis outlines	23

2. LITRAEURE REVIEW OF DIFFRRENT PROTECTION TECHNIQUES 25-45

2.1 General	25
2.2 Electrified railways protection system requirements	25
2.3 Distance protection	26
2.4 Distance relay characteristics and settings	28
2.5 Thermal protection	30

2.6 Back up over-current protection	31
2.6.1 Types of over-current protection used	32
2.6.2 Philosophies of back up over current protection	34
2.6.2.1(On line) Back up definite time over current protection	34
2.6.2.2 (Stand by) Back up over current protection	34
2.7 Literature survey	35
2.8 Proposed protection approach	45
 3. METHODOLOGY OF THE PROPOSED PROTECTION TECHNIQUE	 46-62
3.1 General	46
3.2 AC feeding system	47
3.3 Over head catenary system	49
3.4 Proposed relay algorithm	50
3.4.1 Principle	50
3.4.2 Impedance evaluation	51
3.4.3 Detection algorithm	51
3.4.4 Fault location	55
3.5 Effect of booster transformer	59
3.6 Wrong phase coupling faults	60
3.7 How to select distance relay settings	61
 4. SIMULATION AND RESULTS OF THE PROPOSED TECHNIQUE	 63-80
4.1 System under study	63
4.2 System model	64
4.2.1 General	64
4.2.2 Impedance calculation	64
4.2.3 Areas calculation and comparison	65
4.3 Fault detection study	66
4.4 Determination of fault location	68
4.5 Study of emergency feeding condition	72
4.6 Study of wrong phase coupling	74
4.7 Study of the effect of booster transformer	75
4.8 Selecting proposed distance relay settings	76

5. CONCLUSIONS AND RECOMMENDATIONS FOR FUTURE WORK	81-82
5.1 General	81
5.2 Conclusions	81
5.3 Future work	82
REFERENCES	83-86
