AXIAL COMPRESSIVE STRENGTH OF WEB- TAPERED MEMBERS

By

Mahmoud Ali Abdel-Motaleb

B.Sc. Civil Engineering, Structural Engineering
Shoubra Faculty of Engineering, Benha University, May-2009

In partial fulfillment of the requirements for the degree of
Master of Science in Civil Engineering (Structural).

Supervisors

Prof. Dr. Abdelrahim Khalil Dessouki

Professor of Steel Structures
Faculty of Engineering
Ain Shams University

Dr. Mohamed Mostapha Nassar

Assistant Professor of Structural Engineering
Faculty of Engineering
Ain Shams University

2014

Examiners Committee

1- Prof. Dr. Nabil Sayed Mahmoud (.....)

Professor of Steel Structures

Faculty of Engineering

Mansoura University

2- Prof. Dr. Ahmed Abdelsalam El-Serwi (.....)

Professor of Steel Structures

Faculty of Engineering

Ain Shams University

3- Prof. Dr. Abdelrahim Khalil Dessouki (.....)

Professor of Steel Structures

Faculty of Engineering

Ain Shams University

Statement

This dissertation is submitted to Ain Shams University for the degree of Master of Science in Structural Engineering.

The work included in this thesis has been carried out by the author in the Department of Structural Engineering, Ain Shams University, from June 2012 to June 2014.

No part of this thesis has been submitted for a degree or a qualification at any other university or institution.

Name : Mahmoud Ali Abdel-Motaleb

Signature:

Date : / /

Acknowledgements

First, the author wants to express his deepest gratitude to Prof. Dr. Abdelrahim Dessouki, Faculty of Engineering, Ain Shams University and Dr. Mohamed Nassar, for their continuous support, and precious advice from day one, and to whom the author is extremely indebted.

The author must recognize divine grace for having such dedicated parents, for their constant support all along his educational path, which made this day possible.

Also, the author would thank his wife, his journey companion for facing every possible kind of difficulties with him.

Also, the author is very grateful to his dear friend Eng. Ahmed Omran, for valuable discussions and assistance which brought out this work in the best way.

Finally, many thanks to everybody who ever gave him help and support.

Abstract

The current practice for the design of I-columns in different design codes is based on local stability of individual plate elements (web and flanges), global stability of the whole member, and local-global stability interaction. The current procedure for column design in North American specifications is tested against verified finite element model results. One method is chosen; possible improvements for this method are suggested.

The common practice of steel building frames' manufactures is to use tapered welded built-up members with doubly symmetric and/or singly symmetric cross sections. The current North American specifications AISC 2010 and AISI 2007 address only a small range of practical design situations for frames with web-tapered members. As a result, steel building manufacturers have tended to develop their own methods for design of the wide range of nonprismatic member geometries and configurations encountered in practice.

Hence, a wide range parametric study was conducted to study the behavior of axially loaded tapered members subject to local buckling, global buckling, and local/global buckling interaction, showing all possible modes of failure. Based on the results of this study, the author reported his comments on current design equations in AISC, AISI specifications and recommendations for making the best use of these equations.
