Title of Thesis: NUMERICAL INVESTIGATION FOR CONTROL OF
SMOKE IN CAR SERVICE CENTER

Key Words: Car service center, impulse ventilation, smoke control, Jet fan,
Fire Dynamics Simulator.

Summary:

This study present numerical investigation for designing impulse ventilation system to manage smoke produced due to car on fire in underground workshop at car service center. By studying effect of changing different variables on visibility, temperature and velocity at human level to insure not to exceed limits stated by NFPA to apply evacuation plane. The study is performed using FDS to simulate 13 case studies in workshop its dimension is 50m×25m×4.5m. The workshop contain random distribution of cars, paint furnace and paint store.

Acknowledgment

Firstly, I would like to thank Almighty ALLAH, whom I owe everything, for his generousness and support through all my life.

I would like to thank Prof. Essam E. Khalil, Prof. Mahmoud Ahmed Fouad and Dr. Waleed Abdelmaksod for their guidance and unremitting encouragement. I am grateful to them, and to all my respectful professors, for mentoring me throughout my graduate study.

I extend my gratitude to Eng. Mohamed Aly and Eng. Bassel Alaa for their valuable suggestions and noteworthy discussions. Thanks are also to my colleagues for their encouragement and support.

Finally, I owe a lifelong debt to my parents for their motivation through finishing this thesis and their patience and care and for maintaining a perfect environment for study and research.

HRRPUV	Heat Released Rate Per Unit Volume
IVS	Impulse Ventilation System
LES	Large Eddy Simulation
MW	Megawatt
KW	Kilowatt
NFPA	National Fire Protection Association
MPI	Message Passing Interface

Abstract

Smoke is considered one of the most dangerous factors in car service center in case of fire. As it causes reduce in visibility and deaths due to high temperature or toxicity also prevents applying evacuation plan for workers and cars.

This study presents numerical investigation for designing impulse ventilation system to manage smoke produced due to car on fire in underground workshop at car service center. By studying effect of changing supply rate, extraction rate, the number of jet fans, operating speed of jet fans, the direction of the smoke extraction and the use of smoke barriers on the visibility, temperature and air velocity at human level to insure not to exceed limits stated by NFPA to apply evacuation plan for workers and cars.

The study is performed using Fire dynamic simulator to simulate 13 case studies in underground workshop its dimension is 50 m long \times 25 m width \times 4.5 m height. The workshop contains random distribution of cars, paint furnace and paint store.

The results show that using jet fans and smoke barriers instead of the traditional system of duct ventilation system gives good results in controlling the smoke and allows increasing work space inside the workshop by increasing the maximum height permitted to lift cars. It also shows that Increasing smoke extraction rate than fresh air supply rate makes the entrance act as supply point decreasing smoke concentration at entrance which is highly recommended for evacuation.

Chapter 1 Introduction

1.1 Background

Car parks and service areas pose a range of fire risks, from flammable liquids to high tech equipment, plus a potentially combustible mix of dust, swarf and lubricants. If a fire breaks out, a lot of smoke is produced with high temperature producing poor leakage ability and difficulties in evacuation. When the height of the Workshop is restricted such as our case study after a few minutes, the workshop will probably be full of smoke over the whole height, which makes it very hard for staff to apply evacuation plane or locate the fire extinguishers. Because of this, it is very important provide the workshop with a smoke ventilation system to let staff to eliminate fire at its initial phase in a smokeless environment.

1.1.1 Class A fires

Class A fires involve fabrics and plastics, which pretty much describes the interiors of most makes of vehicle these days. The contents of office area are also highly combustible, including paperwork, files, chairs and desks. A foam fire extinguisher is suitable for use on Class A fires. [1]

1.1.2 Class B fires

Depending on the level of repairs carried out, workshop might include a variety of flammable liquids including Fuel, waxes, thinners, solvents, paints and oils. Fires involving these substances are Class B fires. AFFF foam fire extinguisher is suitable for use on Class B fires. [1]

1.1.3 Class C fires

For electrical equipment, such as testing machines, computers and even printers. CO2 fire extinguisher is suitable for use on Class B fires. [1]
