

# **Patient Safety for Anesthesia in Remote Areas**

*Essay*

***Submitted for Partial Fulfillment of Master Degree  
In Anesthesiology***

*By*

**Eman Elsaeed Ibrahim Ahmed**

*M.B., B.Ch.*

Faculty of Medicine- Ain Shams University

*Under Supervision of*

**Prof. Dr. Nabila Abd Elaziz Fahmy**

Professor of Anesthesia and Intensive Care  
Faculty of Medicine- Ain Shams University

**Dr. Sherif George Anis**

Assistant Professor of Anesthesia and Intensive Care  
Faculty of Medicine- Ain Shams University

**Dr. Raham Hasan Mostafa**

Lecturer of Anesthesia and Intensive Care  
Faculty of Medicine- Ain Shams University

**Faculty of Medicine  
Ain Shams University  
2015**

# Acknowledgment

*First and foremost thanks to **ALLAH**, the most beneficent and merciful.*

*I wish to express my deep appreciation and sincere gratitude to **Prof. Nabila Abd El Aziz fahmy**, Professor of Anesthesiology and Intensive Care Medicine, Ain Shams University, who suggested this subject for reviewing and for her supervision, continuous help and patience. It was a great honor to me to work under her supervision.*

*Also, I would like to express my sincere thanks and deep gratitude to **Dr. Sherif George Anis**, Assistant Professor of Anesthesiology and Intensive Care Medicine, Ain Shams University, for his keen and valuable guidance and encouraging for applying some of these techniques.*

*Special appreciation to **Dr. Raham Hasan Mostafa**, Lecturer of Anesthesiology and Intensive Care Medicine, Ain Shams University, for her kind advice, valuable instructions and continuous support which was the corner stone in the completion of this work,*

*Last but not least, I would like to present a lot of thanks to my family, friends, and to my colleagues, whose without their help and support, this work could not come to birth.*

**Eman Elsaed Ibrahim**

# Introduction

The demand for anesthesia care for procedures performed outside the operating room has dramatically increased in recent years. The delivery of safe anesthesia care may be difficult out-of operating room (OR) settings, due to a variety of challenges, including cramped, dark rooms, inadequate anesthesia support, unfamiliar environment, and variability of monitoring modalities. Although the majority of procedures in remote locations are relatively non-invasive, serious adverse outcomes can occur (**Metzner et al., 2009**).

In the context of anesthesia, a remote site generally refers to a location, which is distant from where the main operating rooms are situated. Remote sites can be classified as follows:

1. A location not designed for the administration of anesthesia, e.g. emergency room, psychiatric wards where electroconvulsive therapy is undertaken, on the ward, e.g., cardioversion, burns dressing changes.
2. A location with fixed equipment, e.g., neuroradiology suite, computerized tomography (CT), magnetic resonance imaging (MRI) and radiation therapy.

## Introduction

---

3. Specially built operating rooms outside the main operating room complex, e.g. dental surgery, day surgery suites, obstetric and burn suites.
4. Specialized diagnostic suites, e.g., gastroendoscopy where anesthesia is requested for the exceptional patient.

**(Tan and Manninen, 2000)**

Monitored Anesthesia Care (MAC) in remote locations poses a significant risk for oversedation and inadequate oxygenation/ventilation due to delays in recognition of respiratory depression. Knowledge of the pharmacokinetic properties of sedative/analgesic drugs, careful monitoring of respiration including capnography, and vigilance can minimize the risk of patient injury in these challenging settings. In addition, general anesthesia with endotracheal intubation may be safer than deep sedation in some patients e.g., obstructive sleep apnea and procedures e.g., prone position, MRI scanner, poor access to patient's airway (**Metzner et al., 2009**).

The types of complications that are commonly assessed include: aspiration events, unscheduled admissions to the hospital, or unplanned admission to an intensive care unit as a direct result of the sedation or anesthesia (ie, because of protracted emesis, prolonged

## Introduction

sedation, or respiratory or cardiac complication), failed procedures resulting from inadequate or problematic anesthesia or sedation, airway injury, position injuries, respiratory arrest and hypoxemic events and cardiac arrest (**Campbell et al., 2014**).

### **Aim of the Work**

To discuss anesthetic consideration for patients anesthetized in remote areas and to highlight patients' safety precautions in remote areas.

# **Chapter 1**

## **Meaning of the Remote Site**

### **Introduction**

In the context of anesthesia, a remote site generally refers to a location, which is distant from where the main operating rooms are situated. Remote sites can be classified as follows:

1. A location not designed for the administration of anesthesia, eg, emergency room, psychiatric wards where electroconvulsive therapy is undertaken, on the ward, eg, cardioversion, burns dressing changes.

2. A location with fixed equipment, eg, neuroradiology suite, computerized tomography (CT), magnetic resonance imaging (MRI) and radiation therapy.

3. Specially built operating rooms outside the main operating room complex, eg, dental surgery, day surgery suites, obstetric and burn suites.

4. Specialized diagnostic suites, eg, gastroendoscopy where anesthesia is requested for the exceptional patient (*Tan and Manninen, 2000*).

Services are requested at many different locations for a diverse range of procedures (*Table 1*). These may be elective or emergency, diagnostic or potentially lifesaving interventions, and

may last from seconds (e.g. cardioversion) through to all-day affairs in the electrophysiology laboratory. The patient group is equally diverse, covering all ages and co-morbidities (**Dallimore and Daly, 2011**).

**Table (1):** Different locations for a diverse range of procedures in remote areas

Location	Procedure
Emergency department	Assistance for resuscitation/difficult airway
Radiology department	Computed tomography (CT)/magnetic resonance imaging
Interventional radiology -Neuroradiology  -Vascular	Cerebral aneurysm coiling, AVM embolization, localized thrombolysis  Elective EVAR, carotid stents  Emergency embolization of e.g. pelvic haemorrhage
Cardiac catheter laboratory	PCI, AICD insertion, EPS, PFO/ASD/VSD closure, ASA, PAVR
Cardiac unit/coronary care	Cardioversion, TOE
Endoscopy suite	Upper and lower gastrointestinal endoscopy, ERCP
Psychiatric hospital	Electroconvulsive therapy
Dental surgery	Dental treatments

Burns unit	Dressing changes
Urology suite	Lithotripsy
Radiotherapy department	Radiotherapy
Hematology unit	Bone marrow biopsies
Obstetric unit	Labour analgesia
AICD, automated implantable cardioverter defibrillator; ASA, alcohol septal ablation; ASD, atrial septal defect; AVM, arteriovenous malformation; EPS, electrophysiology studies; ERCP, endoscopic retrograde cholangiopancreatography; EVAR, endovascular aneurysm repair; PCI, percutaneous coronary intervention; PFO, patent foramen ovale; PAVR, percutaneous aortic valve replacement; TOE, transoesophageal echocardiography; VSD, ventricular septal defect	

*(Metzner et al., 2009)*

The demand for anesthetic expertise outside the operating theatre is increasing. The complexity and diversity of the cases has also increased as interventional radiological procedures replace major surgical procedures, for example, coiling replacing open subarachnoid aneurysm repair and endovascular aneurysm repair (EVAR) replacing open aortic aneurysm repair.

Many of the procedures are undertaken in geographically remote locations, for example electroconvulsive therapy (ECT) in isolated psychiatric units. Such environments require appropriate staffing levels, skill mix and facilities *(Brennan and Nevin, 2014)*.
