Statement

This dissertation is submitted to Ain Shams University for the degree of Doctor of Philosophy in Electrical Engineering (Computer and Systems Engineering).

The work included in this thesis was carried out by the author at Computer and Systems Engineering Department, Faculty of Engineering, Ain Shams University.

No part of this thesis has been submitted for a degree or qualification at other university or institution.

Date : 21 / 01 / 2014

Signature :

Name : Maged Salah Eldin Bayoumi Soliman

Researcher Info

Name: Maged Salah Eldin Bayoumi Soliman

Date of birth: 02 October 1980

Place of birth: Cairo, Egypt

1st Academic Degree: Bachelor of Science (B.Sc.)

Field of specialization: Computer Engineering

University issued the degree: Faculty of Engineering – Cairo University

Degree issuance date : 2002

2nd Academic Degree: Master of Science (M.Sc.)

Field of specialization: Computer Engineering

University issued the degree: Faculty of Engineering – Cairo University

Degree issuance date : 2007

Current job: Project Manager at IBM Egypt

Abstract

Maged Salah Eldin Bayoumi Soliman
On Aggregation Based Routing for Mobile Wireless Sensor
Networks
Doctor of Philosophy Dissertation
Ain Shams University, 2014

The recent technological advances in the field of wireless sensor networks (WSN) have expanded the range of WSN applications. In some of these applications, sensor nodes are mobile rather than static. Also, the recent advances in personal digital assistants (PDAs) allow the existence of multiple mobile sinks to collect the sensors data. These characteristics require the design of new routing protocols to meet the existence of mobile sensors and multiple mobile sinks while taking into consideration the limited resources for sensor nodes especially energy. In-network aggregation is one of the important techniques used to save power consumption by aggregating the data on sensor nodes before transmitting towards the sinks and hence reducing the number of transmissions required. This thesis presents ABRM which is an in-network aggregation based routing protocol for mobile sensor networks with multiple mobile sinks. Compared to CCBR, ABRM yields good aggregation results in addition to a great reduction in power consumption and routing cost. The thesis also proposes three enhancements to ABRM, specifically enhancing the reaction of ABRM towards multiple interests and regarding sink movement, and adapting the beaconing period. These enhancements target to improve the aggregation results and reduce the routing overhead and power consumption. These enhancements are compared to ABRM through theoretical analysis and simulation results. The comparisons show that the enhancements reduce routing overhead, energy consumption, and increase the overall performance of ABRM.

Keywords:

aggregation, mobile, sensors, wireless, networks, routing, WSN, MSN

Acknowledgment

First, All my thanks and gratitude to Allah for accepting my prayers to successfully complete this work, inspiring me to the right direction through my research journey, and helping me through all the hard times.

My deepest thanks to my supervisor Prof. Dr. Hossam Mahmoud Fahmy for putting me on the right track and for pushing me to get out with a work that I will be proud through all my life. Without his support and guidance, the work on thesis would not have been possible.

I would like to thank my supervisor Prof. Dr. Ashraf El-Farghali Salem for his support, advices, and giving me the chance to register for the PhD degree on Faculty of Engineering, Ain Shams University.

I would like to thank my examiners Prof. Dr. Mohamed Adeeb Ghoneimy and Prof. Dr. Dritan Nace for their valuable notes and comments which enriched the work on this thesis.

My deepest thanks to my beloved mother Laila Abdelsattar Khater for her prayers, encouragement, moral support, and advices through my journey to the PhD degree. The work on this thesis could not be accomplished without her encouragement and her persistence to put me back on track through all the hard times.

I would like to thank the authors of “A Context and Content-Based Routing Protocol for Mobile Sensor Networks (CCBR)” paper for their support in modeling CCBR protocol on the simulator. My thanks also to the OMNET++ community for their help and support through the problems I faced with the simulator.

Dedication

I would like to dedicate the work on this thesis to my beloved mother and to Egypt my gorgeous country, hoping it will get rid soon of all the problems it faces, and to evolve and progress to a better prospect with the help of all its loyal sons.

Table of Contents

Abstract	i
Acknowledgment	ii

Table of Contents	iv
List of Figures	vii
List of Tables	x
List of Abbreviations	xi
Chapter 1 Introduction	1
1.1 Applications	1
1.2 Thesis Motivation.....	2
1.3 Thesis Contributions	2
1.4 Thesis Organization.....	3
Chapter 2 Literature Review	4
2.1 Multiple Sinks in Sensor Networks.....	4
2.1.1 Efficient Routing from Multiple Sources to Multiple Sinks in WSN.....	4
2.1.2 A Multi-source Multi-sink Anycast Routing Framework for WSNs (PWave).....	5
2.1.3 ELBR and PBR	6
2.1.4 GLOBAL	6
2.1.5 MUSTER	7
2.2 Routing Protocols that support Mobility in Sensor Networks	8
2.2.1 Routing Protocols that support sensors mobility	8
2.2.2 Routing Protocols that consider sinks mobility	13
2.2.3 Routing Protocols that consider the mobility of sensors and sinks.....	16
2.3 In-network Aggregation Based Routing Protocols	17

2.3.1	Tree-based Approach.....	18
2.3.2	Cluster-based Approach	18
2.3.3	Multipath Approach.....	19
2.3.4	Hybrid Approach	20
2.4	Chapter Conclusion.....	20
Chapter 3 In-Network Aggregation Based Routing Protocol for Mobile Sensor Networks with Multiple Mobile Sinks (ABRM).....		22
3.1	Introduction.....	22
3.2	ABRM Packets Format	22
3.3	ABRM Procedures Flow Description	25
3.4	Chapter Conclusion.....	30
Chapter 4 ABRM Evaluation.....		31
4.1	Theoretical Analysis	31
4.2	Simulation Environment	32
4.3	Simulation Results	33
4.3.1	Impact of Nodes Density	35
4.3.2	The Impact of the Number of Sinks	42
4.4	Chapter Conclusion.....	48
Chapter 5 Enhanced In-Network Aggregation Based Routing Protocol for Mobile Sensor Networks with Multiple Mobile Sinks (E-ABRM).....		50
5.1	Enhancing the reaction of ABRM against Multiple Interests	50
5.2	Enhancing the reaction of ABRM against Sink Movement.....	51
5.3	Adapting Beaconsing Period	56
5.4	Chapter Conclusion.....	57
Chapter 6 E-ABRM Evaluation		59
6.1	Theoretical Analysis	59
6.1.1	Enhancing the reaction of ABRM against Multiple Interests.....	62

6.1.2	Enhancing the reaction of ABRM against Sink Movement	65
6.1.3	Adapting Beaconsing Period	70
6.2	Simulation Results.....	75
6.2.1	Enhancing the reaction of ABRM against Multiple Interests.....	78
6.2.2	Enhancing the reaction of ABRM against Sink Movement	84
6.2.3	Adapting Beaconsing Period	90
6.3	Chapter Conclusion	97
Chapter 7	Conclusions and Future Work	98
Appendix A	ABRM Code	100
