## ABSTRACT

Fermented soybean products (miso) were evaluated for their antimicrobial activity against some microorganisms including Gram- positive bacteria, Gram-negative bacteria, yeast (*Candida albicans*) and filamentous fungi (*Aspergillus flavus*, *A. niger*, *Fusarium verticillioides*, *Rhizopus stolonifer* and *Sclerotinia sclerotiorum*) using agar plate diffusion method. Soy products are generally rich in its phenolic compounds. Isoflavone contents in miso were also determined using HPLC. The results revealed that the miso products have a remarkable inhibition effect on all the tested bacteria and only the two fungal species, *Candida albicans* and *Fusarium verticillioides*. Increasing the storage period of miso (0, 3 and 6 months), the antimicrobial activity increased. Total microbial populations, lactic acid bacteria and fungal counts (yeasts and moulds) were significantly decreased with increasing the storage period of miso. Amylase, lipase and protease activities of the tested pathogenic bacteria and fungi decreased in presence of miso – products.

*In vivo* experiment, the body weight gain of rats, total lipids, liver function, kidney function and estrogen hormone were determined under the effect of feeding on miso.

# ACKNOWLEDGMENT

At first, I would like to thank GOD that allowing me to achieve this work, without his bless any great effort is invaluable.

The author wishes to express her deepest gratitude and sincere thanks to ***Prof. Dr. Mary S. Khalil***, Professor of Microbiology and ***Prof. Dr. Mohamed A. Rizk***, Professor of Microbiology in Botany Department, Faculty of Science, Cairo University for their supervision, guidance and valuable directions and advices throughout the whole work.

The author wishes to express her thanks to ***Dr. Abeer A. Abu-Zaid***, Lecturer in Food Technology Research Institute, Agricultural Research Center, for the facilities offered to accomplish this work.

Finally, a special thanks should be expressed to all staff of the Microbiology Lab in Soy Factory and friends in Food Technology Research Institute, Agricultural Research Center for their encouragement and help with special thanks to ***Dr. Amani Abd el Fattah***.

## **Dedication**

**I would like to dedicate this work to *my parents* that seeded my curiosity and desire for knowledge and thanking them for their unlimited effort, patient and invocation that is unquestionable honored.**

**Mai Mohamed Magdy**

## **Declaration**

**THIS THESIS HAS NOT BEEN  
PREVIOUSLY SUBMITTED FOR ANY  
DEGREE AT THIS OR ANY OTHER  
UNIVERSITY**

**MAI MOHAMED**

# CONTENTS

<b>CHAPTER I</b>	<b>Page</b>
<b>Introduction</b> .....	1
<b>Literature Review</b> .....	4
1.1 Importance of soybean .....	4
1.2-Polyphenolic compounds .....	6
1.2.1 Phenolic compounds .....	6
1.2.1.1 Bioactivities of dietary polyphenols .....	7
A - Anti-atherosclerosis and cardio protection .....	7
B- Antimutagenic/anticarcinogenic properties .....	7
C- Antioxidant and free radical scavenging properties .....	7
D-Antidiabetic effects .....	8
F-Antibacterial activity .....	8
1.2.1.2 Classification and occurrence of dietary Polyphenols .....	8
1.2.2 Isoflavones .....	8
1.2.2.1 Health Benefits of Isoflavones .....	11
1) Coronary Heart Disease .....	11
2) Cancer .....	11
3) Menopause .....	12
4) Bone Health .....	13
1.2.2.2 Absorption and Metabolism of Isoflavones.....	13
1.2.2.3 - Role of isoflavones .....	14
1. 3- Food Fermentation .....	14
1.3.1-Nutritional value of fermented foods .....	15
1.3.2 - Health benefits of fermented foods .....	16
1.3.3 - Solid state fermentation .....	17
1.3.4 - <i>Aspergillus oryzae</i> .....	18
1.3.5-Oriental Fermented Soyfoods .....	18
1.3.6 - Types of oriental fermented soyfoods .....	19
1) Soy temph .....	19
2) Soy taosi .....	19
3) Soy natto .....	19
4) Soy sauce .....	20
5) Soy miso .....	20
1.3.7 - Microflora in miso .....	20
1.4 Antimicrobial activity .....	21
1.4.1 Role of Lactic acid bacteria in miso .....	21
1.5 Anti -nutritional factors .....	22
1.5.1 Phytic acid .....	22

1.6 Enzymes produced in the fermented soybean product (miso) .....	23
1.7 Biological evaluation of miso as fermented soybean product .....	24
<b>2- Materials &amp; Methods</b>	
<b>Materials</b> .....	26
2.1 Microorganisms .....	26
2.2 Media used .....	27
2.3. Raw materials .....	30
<b>Methods</b> .....	31
2.4. Fungal inoculum .....	31
2.5. Miso production .....	31
a) Koji preparation .....	31
b) Soybean preparation .....	31
c) Miso-ricekoji .....	32
d) Miso – barleykoji and miso – soybeankoji .....	32
2.6. Chemical analyses of miso products .....	34
2.6.1 Determination of moisture .....	34
2.6.2 Determination of crude protein .....	34
2.6.3 Determination of ash .....	34
2.6.4 Determination of crude fiber .....	34
2.6.5 Determination of total hydrolysable Carbohydrates .....	35
2.6.6 Determination of pH value .....	35
2.6.7 Determination of phenols .....	35
2.6.8 Determination of Isoflavones .....	36
2.6.9 Determination of phytic acid .....	37
2.7 Antimicrobial activity assay .....	38
2.8 Estimation of microbial population of fermented soybean products .....	39
2.9 Estimation of Enzymes .....	39
2.9.1 Amylolytic activity .....	39
2.9.2 Lipolytic activity .....	40
2.9.3 Proteolytic activity .....	41
3.1 Determination of Lipid profile .....	44
3.1.1 Determination of total lipids .....	44
3.1.2 Determination of serum cholesterol .....	45
3.2 Kidney function .....	47
3.2.1 Determination of serum creatinine .....	46
3.2.2 Determination of urea .....	48
3.3 Liver function .....	50

3.3.1 Determination of serum transaminases activities	50
1) Serum glutamic- oxaloacetic transaminase (sGOT)	50
2) Serum glutamic-pyruvic transaminase (sGPT) .....	51
3.4 Endocrine hormones .....	51
3.4.1 Determination of estrogen in serum .....	51
4 Statistical analysis .....	53
<b>CHAPTER II. Experimental Results</b>	<b>54</b>
1. Chemical analyses .....	54
1.1. Physico - chemical properties of the fermented miso products .....	54
1.2 Determination of total phenolic compounds .....	60
1.3 Isoflavone compounds .....	62
1.4 Phytic acids .....	69
2. Microbiological studies .....	71
2.1. Antimicrobial activity .....	71
2.2 Antifungal activity .....	79
2.3 Microbial population .....	82
2.4 Microbial enzymatic activities .....	84
3. An applied experiment <i>In vivo</i> .....	86
3.1 Growth (Body weight gain) .....	86
3.2 Total lipids and cholesterol .....	89
3.3 Effect of fermented soybean products on liver function of female rats .....	91
3.3.1 Estimation of sGOT .....	91
3.3.2 Estimation of sGPT .....	91
3.4 Effect of fermented soybean products on kidney function of female rats .....	93
3.4.1 Estimation of Urea .....	93
3.4.2 Estimation of Creatinine. ....	93
3.5 Estimation of estrogen hormone .....	95

## CHAPTER I

### INTRODUCTION

Soybean (*Glycine max* L.) is one of the most important crops available to human and animal and can be grown successfully under different climates. Over 4000 years ago, the Chinese discovered the value of the soybeans, a readily available source of edible protein.

The most fermented oriental soy foods in China and Korea is commonly known as jiang; miso in Japan; taicho in Indonesia; and taotsi in the Philippines. miso has been developed in China since 2500 years ago (**Shurtleff and Aoyagi, 1977**).

Japan produces approximately 600, 000 tons of miso annually and exports 18528 tons to the USA, 1476 tons to Canada and approximately 3000 tons to Europe.

Long time ago centuries, miso has been an important part of the Japanese diet, a culture that reverses food as medicine. Miso is a smooth paste made from soybeans and /or grains such as rice or barley, salt and mold culture, aged in cedar vats for one to three years. It is good source of protein, calcium and zinc (**Messina, 1999**).

Soybean was introduced into Egypt in 1954 and was grown in the experimental station of ministry of agriculture. However, it becomes commercially known in 1970 (**El-Bedwy, 1984**).

In Egypt, in 1996 the cultivated area was about 37 thousand feddans which yielded about 40 thousand tons of seeds (**FAO, 1996**). There is shortage in edible oils and large amounts are imported to overcome this problem. The

governmental policy goal is to increase and expand the cultivated area with soybean which is considered the second oil crop in Egypt beside its high content of protein .Soybean products have attracted increased attention because of their potential to afford protection against a variety of disorders, including cancer, hyperlipemias, osteoporosis, cardiovascular diseases and various forms of chronic renal diseases (**Bhathena and Velasquez, 2002** and **Yamamoto *et al.*, 2003**).

The antioxidative activity of fermented soybean products, inoculated with *Aspergillus oryzae*, *Rhizopus oligosporum* and *Bacillus natto*, respectively was significantly higher than in non – fermented steamed soybean (**Santiago *et al.*, 1992** and **Berghofer *et al.*, 1998**).
