RESPONSE OF SOME SNAP BEAN CULTIVARS TO SOWING DATES AND GAMMA IRRADIATION

By

AMR MOHAMED MOUNIR FARRAG MOHAMED

B.Sc. Agric. Sc. (Horticulture), Ain Shams University, 2003

M.Sc. Agric. Sc. (Vegetable Crops), Ain Shams University, 2011

This thesis for Ph.D. degree has been approved by:

Dr. Shaban Desuki Abou-Hussien

Researcher Prof. of vegetable crops, National Research center

Dr. Mohamed Emam Ragab

Prof. of Vegetable Crops, Faculty of Agriculture, Ain Shams
University

Dr. Ahmed Abou El-Yazied Abd El-Hafize

Prof. of Vegetable Crops, Faculty of Agriculture, Ain Shams
University

Dr. Ibrahim Ibrahim El-Oksh

Prof. Emeritus of Vegetable Crops, Faculty of Agriculture, Ain Shams
University

Date of Examination: 26 /12 / 2015

RESPONSE OF SOME SNAP BEAN CULTIVARS TO SOWING DATES AND GAMMA IRRADIATION

By

AMR MOHAMED MOUNIR FARRAG MOHAMED

B.Sc. Agric. Sc. (Horticulture), Ain Shams University, 2003

M.Sc. Agric. Sc. (Vegetable Crops), Ain Shams University, 2011

Under the supervision of:

Dr. Ibrahim Ibrahim El-Oksh

Prof. Emeritus of Vegetable Crops, Department of Horticulture
Faculty of Agriculture, Ain Shams University (Principal Supervisor).

Dr. Ahmed Abou El-Yazied Abd El-Hafize

Prof. of Vegetable Crops, Department of Horticulture Faculty of
Agriculture, Ain Shams University.

Dr. Ibrahim Orabi Ahmed

Researcher Prof. Emeritus of Plant Physiology, Department of
Natural Products Research, National Center for Radiation Research
and Technology.

ABSTARACT

Amr Mohamed Mounir Farrag : Response of Some Snap Bean Cultivars to Sowing Dates and Gamma Irradiation. Unpublished Ph.D. Thesis, Department of Horticulture, Faculty of Agriculture, Ain Shams University, 2015.

The effect of three doses of gamma irradiation (0, 20 and 30 Gy) and their effect on three cultivars of snap bean Paulista, Xera and Bronco under different sowing dates ,i.e. the 1st, 8th and 15th of October was studied in an experimental farm during 2011/2012 and 2012/2013 seasons. The results revealed that the 1st of October scored the highest leaf and stem dry weight at all ages , plant length , leaf number at 30 DAP , leaf and stem fresh weight at 45 and 60 DAP, leaf area, number of branches and leaf area at 60 DAP. On the other hand, the 8th of October led to the highest values of plant length at all ages, leaf and stem fresh weight and leaf dry weight at 30 DAP, leaf area and number of branches at 30 and 45 DAP, stem fresh weight at 45 DAP and leaf number at 30 and 60 DAP. Regarding the effect of cultivars, cv. Bronco gave the highest leaf and stem fresh weight and leaf area at all ages, leaf number at 30 DAP and leaf dry weight at 45 and 60 DAP, whereas cultivar Paulista had the highest leaf and branch number and stem dry weight, also cultivar Xera gave the highest plant length and branch number at 30 DAP and leaf number and stem fresh and dry weight. Concerning gamma irradiation effect , 20 Gy significantly increased all growth parameters except leaf fresh weight at 45 DAP, stem dry weight at 30 DAP, plant length, leaf number and stem dry weight at 30 and 60 DAP, number of branches and leaf area at 60 DAP. On the other hand, 30 Gy produced the highest leaf fresh weight at 30 and 45 DAP, leaf number, number of branches, leaf dry weight and leaf area at 60 DAP. As for chemical constituents ,the 1st and 8th of October scored the highest gibberellin and indole acetic acid content, while the 15th of October gave the highest values of chlorophyll reading , total phenols and proline content in the first

season. It was found that cultivar Paulista significantly increased chlorophyll reading, total carbohydrate in the second season, while cultivar Xera led to the highest chlorophyll reading and proline content. It was found also that cultivar Bronco scored the highest total phenols in leaves. Regarding the effect of gamma irradiation, 20 Gy significantly increased chlorophyll reading, proline content, gibberellin and indole acetic acid, whereas 30 Gy led to the highest chlorophyll reading, total carbohydrate, total phenols, proline content, indole acetic acid and gibberellin. Concerning yield and its components, the 8th of October gave the highest pod number per plant, plant yield in the second season, local yield class1, exportable yield, total yield and the lowest local yield class 2 per feddan. Cultivar Paulista produced the highest pod length, local yield class1 and the lowest local yield class 2, while cv. Bronco had the highest local yield class 2 and local yield class1, cultivar Xera gave the highest pod length, plant yield, and pod number per plant, exportable yield, total yield and the lowest local yield class 2 per feddan. The 20 Gy of gamma irradiation doses produced the highest pod length and fresh weight, plant yield, and pod number per plant, exportable yield, local yield class1 and total yield and lowest local yield class 2 per feddan. The 30 Gy of gamma irradiation doses significantly increased pod thickness, pod length, pod fresh and dry weight and lowest local yield class 2 per feddan. Results indicated that the 1st and 15th of October produced the highest fiber percent in green pod, whereas the 15th of October increased total sugars and protein percentage in green pods. As for cultivars, cv. Paulista produced the highest fiber and protein percentage in green pods and cv. Bronco gave the highest percent of total sugars in green pods. Regarding the effect of gamma irradiation, 30 Gy significantly increased total sugars, fiber and protein percentage in green pods.

Key words: Snap bean, cultivars, sowing dates and gamma irradiation.

ACKNOWLEDGEMENT

Firstly, I direct my deepest thanks to **ALLAH** who gave me the power and patience to finish this work.

The author wishes to express his great thanks and deep gratitude to **Prof. Dr. Ibrahim Ibrahim El-Oksh**, Emeritus Professor of Vegetable Crops, Faculty of Agriculture, Ain Shams University, for suggesting the current study and his supervision and help during the course of this study and during preparing and reviewing the manuscript.

Deep gratitude and thanks is also due to **Dr. Ahmed Abou El-Yazied Abd El-Hafize**, Professor of Vegetable Crops, Faculty of Agriculture, Ain Shams University, for his kind supervision, advice, valuable assistance, during the preparation of this thesis.

I would like to thank **Prof. Dr. Ibrahim Orabi Ahmed**, Emeritus Professor of plant physiology in the National Center for Radiation Research and Technology, for his supervision, great support and continued help during the preparation of this work.

I would like also to express my deep thanks to **Dr. Ahmed Abd El-Hamid Zahran** Lecturer of plant physiology in the National Center for Radiation Research and Technology, for his effort and unfailing support and interest during the course of this work.

Thanks are also extended to **the staff members** of the Department of Horticulture, Faculty of Agriculture, Ain Shams University and **the staff members** of the Department of natural products in National Center for Radiation Research and Technology for their encouragement and help during the course of this work.

Finally, deepest gratitude for **my Late mother, my father and my wife** for their continuous help and encouragement through this work.

1. INTRODUCTION

Snap bean (*Phaseolus vulgaris* L.) is one of the most important legumes of family Fabaceae worldwide for direct human consumption. The crop is consumed principally for its dry (mature) beans, shell beans (seeds at physiological maturity) and green pods. When consumed as seed, beans constitute an important source of dietary protein (22% of seed weight). Annual production of dry beans is around 15 million tonnes and average yield is 700 kg ha⁻¹, although yield in certain countries reach 2000-3000 kg ha⁻¹.

Annual production of green beans is around 4.5 million tones, with the largest production around the Mediterranean and the USA. The top producers of snap bean are China, Indonesia, India, Turkey, Thailand and Egypt at the 6th rank with 263, 080 tonnes (FAO 2013). In Egypt snap bean is a major vegetable export crop second to potato in terms of foreign exchange earnings.

The main factor which affects the productivity of high quality exportable yield is the good choice of the suitable cultivars because some cultivars are suitable to the European markets than others. Pod quality characters are the major factor, which affect the percentage of exportable yield. Many investigators reported that the vegetative growth, total and exportable yield as well as pod quality of snap bean are greatly affected by genotype of the varieties (Nassar ,1986; Abou El –Hassan *et al.* ,1993; Mohamed ,1997 ; Amer *et al.*,2002a).

Lately a lot of cultivars are introduced in the local market, and they differ in their growth habit, sowing location, yield amount, pod characters and quality. Moreover, Amer *et al.* (2002b) concluded that the difference in pod yield of bean varieties might be attributed to the different genetic potentiality of every variety.

Also it is well known that common bean is environmentally sensitive to environmental stresses that may occur in the field
