INDUCTION OF TYLCV RESISTANT PLANTS THROUGH TOOLS OF MOLECULAR BIOLOGY

By

ADEL ABD EL-SABOUR A. REZK

DEGREE: Ph.D. in Agricultural science

(Plant Pathology)

This thesis for Ph.D. Degree has been approved by:

Prof. Dr. Fawzy M. Abo El- Abbas.....*Fawzy M. Abo El- Abbas*
Prof. of Plant pathology, Plant Pathology Department,
Faculty of Agriculture, Ain Shams University.

Prof. Dr. Ibrahim A. Mohamed*Ibrahim A. Mohamed*
Prof. of Plant Pathology, Plant Pathology Department,
Faculty of Agriculture, Cairo University.

Prof. Dr. Aly M. Abd-El Salam*Aly M. Abd-El Salam*
Prof. of Plant Pathology, Plant Pathology Department,
Faculty of Agriculture, Cairo University.

Prof. Dr. Nagla A. Abdallah.....*Nagla A. Abdallah*
Prof. of genetics, Genetics Department, Faculty of Agriculture,
Cairo University.

Date: 1 / 4 / 2006

INDUCTION OF TYLCV RESISTANT PLANTS THROUGH TOOLS OF MOLECULAR BIOLOGY

BY

ADEL ABD EL-SABOUR A. REZK

B.Sc. Agric. Sciences (Plant Pathology), Cairo University, 1993

M.Sc. Agric. Sciences (Plant Pathology), Ain Shams University, 2001

Under the supervision of:

Dr. Aly M. Abdel Salam

Professor of Plant Pathology, Department of Plant Pathology,
Faculty of Agriculture, Cairo University.

Dr. Nagla A. Abdallah

Professor, of Genetics Department of Genetics, Faculty of
Agriculture, Cairo University.

Dr. Hamed M. Mazyad

Emeritus Professor of Plant Pathology, Plant Pathology Research
Institute, Agricultural Research Center (ARC), Giza.

ACKNOWLEDGMENT

I'd like to convey special thanks to my wife for her care and encouragement during my study.

*I'd like to express my deepest thanks to my supervisors **Prof. Dr. Aly Abdel Salam** Professor of Plant Pathology, Faculty Of Agric, Cairo University, and **Prof. Dr. Nagla Abdallah** Professor Of Genetics, Faculty Of Agric, Cairo University for their kind supervision, valuable guidance, and helpful assistance throughout the present investigation.*

*special thanks to **Prof. Dr. Hamed M. Mazyad**, Professor of Plant Pathology, Plant Pathology Research Institute, Virus Department, ARC, Egypt. I'm grateful to him for giving me the chance to travel to USA and learn*

*I wish to express my deepest gratitude and sincere appreciation to; **Prof. Dr. Douglas Maxwell** and **Prof. Dr. Mark Nakhla**, Plant Pathology Department, Wisconsin University, USA, for his great caring about me during my visit to USA; and their vision, overwhelming scientific support and helping me to get the experience and a progress in my work. Also I'd like to thank Tom Hammond Ph. D. student in Wisconsin University, to sharing me to solve many problems I face during work.*

I'd like to thank all my colleagues in the virus department, my friends in the molecular biology lab, plant pathology research institute, ARC, Egypt, for their continuous support and help.

Adel A. Rezk

Title of Thesis: Induction of TYLCV resistant plants THROUGH TOOLS OF MOLECULAR BIOLOGY

Supervisors: Prof. Dr. Aly M. Abdel-Salam,

Prof. Dr. . Nagla A. Abdallah

Prof. Dr. Hamed M. Mazyad

Department : Plant Pathology

Branch : Plant Pathology

Approval: 1/4/2006

ABSTRACT

Control of diseases caused by plant viruses requires an understanding of the virus, its replication, the vectors that spread the virus, and the deployment of useful genes of resistance in high-yielding varieties. As many crops, tomatoes are infected by many diseases. However, the disease caused by *Tomato yellow leaf curl virus* (TYLCV) is the most limiting factor causing remarkable yield losses. Recent advances in molecular biology and the development of new techniques to introduce foreign genes into plant cells gave us a chance to development of new strategies to control diseases caused by plant viruses. Pathogen-Derived Resistance (PDR) is among the most promising strategy. The concept of PDR based on the introduction of gene(s) derived from the pathogen (virus) into the cell of the host plant to trigger resistance against that pathogen. Post-transcriptional gene silencing (PTGS) is a nucleotide sequence specific RNA turnover mechanism produced by plant cell as a natural mechanism against virus infection. Double strands of short (21-25 nt) interference RNA (siRNA) mediate this natural defense mechanism. The PTGS mechanism is becoming powerful tools for reducing expression of a certain viral gene and controlling infection. In the purpose of controlling the TYLCV, three regions from the viral genome located in the overlap regions between C1/C2, C2/C3 and V1/V2 were used for studying their efficiency in working as siRNA to target viral DNA accumulation in plant cells. Constructs were prepared by cloning each of the three regions both in the sense or sense/antisense directions in the binary vector pFGC5941 and introduced into tomato and tobacco plant tissues *via* Agro-infiltration technique. Additional construct containing the three regions together in the sense/antisense directions was also used as a control to prove that either one of the selected regions may activate the siRNA mechanism. All plants were challenged with virus using the TYLCV-Eg infectious clone 15 days post infiltration. The obtained results revealed that only sense/antisense (as) constructs inhibit or reduce accumulation of viral genome due to the induction of siRNA mechanism. However, infiltrated plants with the construct containing the asC1/C2 region proved to be the best region for initiating PTGS as it inhibited the accumulation of the viral genome completely as well as it prevented the appearance of viral symptoms in all tested plants. This may be due to its role in silencing the expression of two very important viral genes which express the replication associated protein (Rep) and transactivator protein for the viral sense promoter. However, the other two regions showed a high, but not a complete, level of interference for genome accumulation and viral infection symptoms. The obtained results may also be explained based on the length of the cloned fragments, as it was only 116 bp for C1/C2 region compared to the other regions (280 bp for C2/C3 and 260 bp for V1/V2) and / or the type of the genes they interfere. It can be concluded that this mechanism can result in higher viral resistance in tomato against TYLCV.
