Protective Effect of Clove and Ginger Extracts on the Biological and Biochemical Changes of Diabetic Rats

Thesis Submitted by

Enass El-Sayed Ahmed Abd El-Hamid

(B.Sc., Biochemistry and Nutrition, 2009)

In partial fulfillment for

Master degree in science (M.Sc)

Biochemistry and Nutrition

Under Supervision of

Dr.Hanem Abd El- Sabour Seda

Prof. of food Technology
Biochemistry and Nutrition Dept.
Faculty of Women for Arts,
Science, and Education
Ain Shams University

Dr.Fatma Abd El-Hamid Khalil

Prof. of Nutrition and head of
Biochemistry and Nutrition Dept.
Faculty of Women for Arts,
Science, and Education
Ain Shams University

Dr. Nahla Hussein Ali

Assistant Prof. of Nutrition
Biochemistry and Nutrition Dept.
Faculty of Women for Arts, Science, and Education
Ain Shams University

2014

Acknowledgment

First and foremost, I feel always indebted to **ALLAH**, the kindest and the most merciful.

I am greatly thankful to **Prof. Dr. Hanem Abd El - Sabour Seda**, professor of Food Technology, Department of Biochemistry and Nutrition, Faculty of Women, Ain Shams University for her valuable instruction, meticulous supervision and kind support.

My deepest gratitude and sincere appreciation goes to **Prof. Dr. Fatma Abd El-Hamid Khalil**, professor of Nutrition Department of Biochemistry and Nutrition, Faculty of Women, Ain Shams University for her valuable supervision, great help, and guidance and sincere advice during all steps of this work. No words seem to be sufficient to describe, to her owe much.

I offer my regards and blessings to **Dr. Nahla Hussein Ali** Assistant Professor of Nutrition, Department of Biochemistry and Nutrition, Faculty of Women, Ain Shams University for her help during the practical part of this work.

With great pleasure, I would like to express my sincere gratitude to the staff members of Biochemistry and Nutrition Department, Faculty of Women, Ain Shams University for their sincere help and support.

Finally, my thanks and appreciation to everyone who gave me an un failing support and assistant at this time.

Abstract

The aim of the present study was to investigate the effects of oral administration of clove and/or ginger extracts at a level of 50 mg/kg b.wt./day of clove, 50 mg/kg b.wt./day of ginger and 25 mg/kg b.wt./day of each for a period of 6 weeks on streptozotocin (STZ) induced diabetic rats. Results showed that diabetic rats had significant increase in the levels of serum glucose by 134.06%, malondialdehyde (MDA) by 91.59%, liver enzymes activity, kidney functions as well as atherogenic index (AI) and lipids profile except HDL-C, while blood reduced glutathione (GSH) content, serum insulin, and liver glycogen were significantly lowered as compared to normal control rats. The elevated serum parameters were significantly reduced by treatment for 6 weeks with clove and/or ginger extracts except serum HDL-C, insulin, GSH and liver glycogen were significantly increased as compared with diabetic control rats.

It was concluded that, administration of clove and ginger at the tested doses had anti-diabetic and anti-hyperlipidemic properties as well as good antioxidant potential (eugenol, ellagic acid in clove and gingerols, shogaols in ginger).

List of Abbreviations

ACE: Angiotensin Converting enzyme

ADS: Antioxidant Defense System

AGE: Advanced Glycated End

AI: Atherogenic Index

AIN-93 M: American Institute of Nutrition

ALP: Alkaline Phosphatase

ALT: Alanine Aminotransferase

AO: Antioxidant

AST: Aspartate Aminotransferase

B. wt.: Body weight

CAT: Catalase

DM: Diabetes Mellitus

DMH: Di-Methyl hydrazine

DNA: Deoxyribo Nucleic Acid

E-Coli: Escherichia Coli

GDH: Glutamate Dehydrogenase

GDM: Gestational Diabetes Mellitus

GERD: Gastro-Esophageal Reflux Disease

G6Pase: Glucose 6 Phosphatase

G6 PD: Glucose 6 Phosphate Dehydrogenase

GPX: Glutathione Peroxidase

GR: Glutathione Reductase

GSH: Reduced Glutathione

GST: Glutathione-S- Transferase

HBA1C: Glycosylated Hemoglobin

HDL-C: High Density Lipoprotein Cholesterol

HMG-coA: 3-Hydroxy-3- Methyl Glutaryl CO Enzyme

4-HNE: 4-Hydroxy-2-Non Enal

HP: Helicobacter Pylori

5-HT3: 5-Hydroxy Tryptamine 3

IDDM: Insulin Dependent Diabetes Mellitus

LDL-C: Low Density Lipoprotein Cholesterol

MDA: Malondialdehyde

MDH: Malate Dehydrogenase

MODY: Maturity Onset Diabetes of Young

NAC: N-Acetyl Cysteine

NCV: Nerve Conduction Velocity

NIDDM: Non- Insulin Dependent Diabetes Mellitus

NIN: National Institute of Nutrition

NO: Nitric Oxide

NSAIDs: Non-Steroidal Anti Inflammatory Drugs

PEPCK: Phosphoenol Pyruvate Carbxy Kinase

PUFA: Polyunsaturated Fatty Acid

RBP: Retinoid Binding Protein

ROS: Reactive Oxygen Species

S.D.: Standard Deviation

SOD: Superoxide Dismutase

SPSS: Statistical Package for Social Science

St.: Standard

STZ: Streptozotocin

TAG: Triacylglycerols

TC: Total cholesterol

TL: Total lipid

VEGF: Vascular Endothelial Growth Factor

VLDL-C: Very Low Density Lipoprotein Cholesterol

Dedication

This work is dedicated to my beloved father, mother and brother whose affection, love and encouragement make me able to get such success.

List of Contents

Subject	Page NO.
Introduction.	1
Aim of the work.	5
Review of Literature.	6
▪ Definition of Diabetes Mellitus.	6
▪ Classification of Diabetes Mellitus.	7
▪ Diabetes and Oxidative Stress.	10
▪ Antioxidant Defence System.	13
▪ Spices as a Source of Antioxidants.	19
▪ Spices and Diabetes Mellitus.	20
▪ Clove (<i>Syzygium aromaticum</i>).	21
▪ Ginger (<i>Zingiber officinale</i>).	31
Materials and methods.	51
Materials.	51
Methods.	54
1-Preparation of aqueous extracts of the herbs.	54
2-Experimental animals and work design.	54
3- Some of the biological evaluations.	56
4- Biochemical measurements:	58
4.1. Determination of Serum Glucose.	58
4.2. Determination of Serum Insulin.	59
4.3. Determination of Glycogen Content in Liver Tissues.	61
4.4. Determination of Blood Reduced Glutathione (GSH).	63
4.5. Determination of Malondialdehyde (MDA) level.	65
4.6. Determination of serum Lipids profile.	66
4.6.1. Determination of Total Lipid (TL).	66
4.6.2. Determination of Total Cholesterol (TC).	67
4.6.3. Determination of Triacylglycerols (TAG).	69

4.6.4. Determination of High Density Lipoprotein-Cholesterol (HDL- C).	70
4.6.5. Calculation of Low and Very Low Density Lipoprotein (LDL and VLDL Cholesterol).	72
4.6.6. Calculaion of the Atherogenic Index (AI).	72
4.7. Determination of Liver Function Tests:	72
4.7.1. Determination of Alanine Aminotransferase Enzyme Activity.	72
4.7.2. Determination of Aspartate Aminotransferase Enzyme Activity.	74
4.8. Determination of Kidney Function Tests:	75
4.8.1. Determination of Serum Urea.	75
4.8.2. Determination of Serum Creatinine.	77
4.8.3. Determination of Serum Uric acid.	78
- Statistical analysis.	79
Results.	80
1- Biological evaluation of administration of clove and/or ginger extracts of healthy and diabetic rats.	80
2- Effect of clove and/or ginger extracts on serum glucose, insulin and liver glycogen of healthy and diabetic rats.	87
3- Effect of clove and/or ginger extracts on reduced glutathione (GSH) and malondialdehyde (MDA) levels of healthy and diabetic rats.	87
4- Effect of clove and/or ginger extracts on serum lipids profile and atherogenic index of healthy and diabetic rats.	92
5- Effect of clove and/or ginger extracts on liver enzymes activity in healthy and diabetic rats.	98
6- Effect of clove and/or ginger extracts on kidney function tests of healthy and diabetic rats	98
Discussion.	104
A- Some of the biological evaluations:	104
1- Food intake, body weight gain and feed efficiency ratio.	104

2- Relative weight of organs.	106
B-Biochemical measurements:	106
1- The levels of glucose, insulin and liver glycogen content.	106
2- Malondialdehyde and reduced glutathione.	109
3- Lipids profile and atherogenic index.	113
4- Liver function tests.	116
5- Kidney function tests.	118
Summary.	121
Conclusion and Recommendations.	126
Reference.	127
Arabic summary.

17) Triacylglycerols of healthy and diabetic rats which received orally clove and/or ginger extracts.	95
18) VLDL-c of healthy and diabetic rats which received orally clove and/or ginger extracts.	95
19) HDL-c of healthy and diabetic rats which received orally clove and/or ginger extracts.	96
20) LDL-c of healthy and diabetic rats which received orally clove and/or ginger extracts.	96
21) Atherogenic index of healthy and diabetic rats which received orally clove and/or ginger extracts.	97
22) Alanine aminotranseferase activity (ALT) of healthy and diabetic rats which received orally clove and/or ginger extracts.	101
23) Aspartate aminotranseferase activity (AST) of healthy and diabetic rats which received orally clove and/or ginger extracts.	101
24) Urea level of healthy and diabetic rats which received orally clove and/or ginger extracts.	102
25) Creatinine level of healthy and diabetic rats which received orally clove and/or ginger extracts.	102
26) Uric acid level of healthy and diabetic rats which received orally clove and/or ginger extracts.	103

Introduction

Diabetes is a chronic metabolic disorder affecting a major proportion of the population worldwide. Diabetes mellitus is a disease due to abnormality of glucose metabolism and it is mainly linked with low plasma insulin level or insensitivity of target organs to insulin and results in chronic hyperglycemia, a clinical hallmark of diabetes (*Veerapur et al., 2012*). The sustained hyperglycemia leads to a further impairment of insulin production by beta cells the so-called glucose toxicity. Hyperglycemia occurring in diabetes does not only damage cellular proteins, membrane lipids and nucleic acids, but also increase the rate of onset of disease complications (*Srinivasan et al., 2013*). The acute complications of diabetes mellitus include hyperglycemia, diabetic ketoacidosis, lactic acidosis, hyperosmolar non-ketotic coma (*Andrew, 2010*). The late complications include peripheral vascular disease, coronary heart disease, retinopathy, neuropathy, nephropathy and stroke (*Chaudhry et al., 2013*).

Oxidative stress has been reported to be a major factor in the pathogenesis of all diabetic complications. Free radicals are formed in diabetes by glucose oxidation, non-enzymatic glycation of proteins, and the subsequent oxidative degradation of glycated proteins. Abnormally high levels of free radicals and the simultaneous decline of antioxidant defense mechanisms can lead to damage of cellular organelles and enzymes and increased lipid peroxidation (*Dominic et al., 2002*). There is a great interest in the potential contribution of

increased oxidative stress to the pathogenesis of diabetes as well as its complications. Hyperglycemia is a widely known cause of enhanced free radical concentrations and decreased antioxidant defense system (*Ahmed, 2005*).

Humans have evolved with antioxidant systems to protect against free radicals. These systems include some antioxidants produced in the body (endogenous) and others obtained from diet (exogenous) (*Kangralkar et al., 2010*). However, the lowering oxidative stress and activation of antioxidant defense mechanisms, using medicinal plants and dietary antioxidants, prevents endothelial dysfunction and cell damage in diabetes, atherosclerosis and cardiovascular diseases (*Al-Azhary, 2011*).

Before the discovery of insulin in the 1920s and the development of oral hypoglycaemic agents, diabetes mellitus was treated mainly by a combination of fasting, diet control and plant therapeutics (*Al-Amin et al., 2006*). Oral hypoglycemic agents, drugs may be effective for glycemic control, but they come with their attendant side effects such as liver disorders, abdominal pain, renal tumors, hepatic injury, acute hepatitis and abdominal fullness (*El Kaissi and Sherbeeni, 2011*).

Herbs and spices have been widely used as a traditional medicine to treat various chronic or acute diseases since they contain high levels of various active phytochemicals, including, flavonoids, terpenoids, lignans, sulfides, polyphenolics and coumarins (*Jin and Cho, 2011*).
