

Amniotic Fluid Lamellar Body Count as a Predictor of Fetal Lung Maturity in Diabetic Patients Undergoing Elective Caesarean Section

Thesis

Submitted for partial fulfillment of
The Master Degree in **Obstetrics& Gynecology**

Presented by:

Nouran Mahmoud Atif Abul-Fadl

M.B.B.Ch. 2007

Ain Shams University

Former Training Resident at Military Hospitals

Training Resident at Ahmed Maher Teaching Hospital

Supervised by:

Prof. Dr. Mohammad Abdul-Hamid Yehia

Professor of Obstetrics &Gynecology

Faculty of Medicine - Ain Shams University

Dr. Ahmed Hamdy Nagib Abdul-Rahman

Assistant Professor of Obstetrics &Gynecology

Faculty of Medicine - Ain Shams University

Dr. Mostafa Fouad Gomaa

Lecturer of Obstetrics &Gynecology

Faculty of Medicine - Ain Shams University

**Faculty of Medicine
Ain Shams University**

2014

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

وَقُلْ اَعْمَلُوا فَسَيَرَى اللَّهُ عَمَلَكُمْ
وَرَسُولُهُ وَالْمُؤْمِنُونَ

صدق الله العظيم

سورة التوبة آية (105)

Acknowledgement

*First of all, I thank **God** who gave me strength to fulfill this project throughout to completion.*

*Then I would like to express my sincere gratitude to **Prof. Dr. Mohammad Abdul-Hamid Yehia** Prof. of Obstet. and Gyn. Ain shams University for his Generous Supervision, precious time and the advice he offered me in this study. I consider myself to be very lucky to be under his supervision.*

*My deep gratitude goes to **Dr. Ahmed Hamdy Nagib** Assistant Prof. of Obstet. And Gyn. Ain shams university for his invaluable efforts and tireless guidance and meticulous supervision throughout this work,*

*I can't forget the great help of **Dr. Mostafa Fouad Gomaa** Lecturer of Obstet. And Gyn. Ain shams university for his patience and support to get this work into light.*

Finally I'd like to dedicate this piece of work to my husband and parents for their help, faith and support and to the patients whom I can't work without and to all staff members and anyone who helped me to complete this work,

Nouran Mahmoud Atif Abul-Fadl

List of Abbreviations

ACOG	: American College of Obstetrician
ADA	: American Diabetic Association
ALI	: Acute Lung Injury
AMP	: Adenosine Monophosphate
ARDS	: Adult Respiratory Distress Syndrome
ABCA3	: ATP-Binding Casette Transporter A3
AQPS	: Aquaporin Channel
A-FLM	: Amniostat
AUC	: Area Under the Curve
APGAR	: Appearance, Pulse, Grimace, Activity, Respiration
BMI	: Body Mass Index
CaMK	: Calcium-Calmodulin Dependant Protein Kinase
CBC	: Complete Blood Count
CDP	: Continuous Distending Pressure
CNP	: Continuous Negative Pressure
CPAP	: Continuous Positive Airway Pressure
CPDA	: Citrate phosphate dextrose adenine
CAP	: College of American Pathologists
CS	: Cesarean Section
CVD	: Cardiovascular diseases
DM	: Diabetes Mellitus
DPH	: Diphenylhexatriane
ECG	: Electrocardiogram
EFW	: Estimated Fetal Weight

FHR	: Fetal Heart Rate
FLM	: Fetal Lung Maturity
FRC	: Functional Residual Capacity
F Pol	: Fluorescence Polarization
F _a CO ₂	: Fraction of arterial carbon dioxide
GA	: Gestational Age
GDM	: Gestational Diabetes Mellitus
IDM	: Infant of Diabetic Mother
IDDM	: Insulin Dependent Diabetes Mellitus
IPPV	: Intermittent Positive Pressure Ventilation
IRDS	: Infant Respiratory Distress Syndrome
IVH	: Intraventricular Hemorrhage
L/S	: Lecithin /Sphingomyelin Ratio
LBC	: Lamellar Body Count
LGA	: Large for Gestational Age
LMP	: Last Menstrual Period
LSCS	: Lower Segment Cesarean Section
MG	: Multigravida
NEC	: Necrotizing Enterocolis
NBD-PC	: Fluorescence polarization
PCV	: Packed Cell Volume
PG	: Primigravida
PGDM	: Pregestational Diabetes Mellitus
PI	: Phosphatidyl Inositol
PKA	: Protein Kinase A
PKC	: Protein Kinase C

PVH	: Periventricular Hemorrhage
P/V	: Ventilation Perfusion Imbalance
P _a CO ₂	: Partial Pressure of arterial Carbon Dioxide
P _a O ₂	: Partial Pressure of arterial Oxygen
RDS	: Respiratory Distress Syndrome
ROP	: Retinopathy Of Prematurity
ROC	: Receiver Operating Characteristic
SP-A	: Surfactant Protein A
SP-B	: Surfactant Protein B
SP-C	: Surfactant Protein C
TD _x FLM	: Surfactant/Albumin Ratio
THAM	: Tris-Hydroxy-Amino-Methane
TTN	: Transient Tachypnea of Newborn
TM	: Tubular Myelin
WHO	: World Health Organization

Introduction

Introduction In the process of lung maturity, the lungs are the last vital organs that need to develop in order to enable life in the extrauterine environment. Despite the development of artificial surfactants and advances in respiratory support, respiratory distress syndrome (RDS) continues to be a major problem in newborns. **(Stoll and Kleigman, 2000)**

As the successful establishment of adequate lung function at birth is dependent on the maturity of the respiratory system **(Stoll and Kleigman, 2000)**, the ability to accurately predict neonatal lung maturity would be a helpful adjunct in the management of pregnancies when premature delivery is expected or administration of glucocorticoids is needed. **(Dubin, 1989)**

Although respiratory distress syndrome (RDS) is generally a disease of preterm neonates, it does develop in term newborns, especially in the setting of sepsis or meconium aspiration. It was also found that male infants are more likely to develop RDS than females, and white infants are more frequently and severely affected than black infants. **(Jobe, 2004)**

Because of the importance of the lung function for survival, perinatal research and care are directed to the examination of its maturity. The accurate antenatal prediction

of fetal lung maturity (FLM) based on results from amniotic fluid samples is of utmost importance in the prevention of neonatal respiratory distress syndrome and its complications. **(Jobe, 1990)**

Delivery for fetal indications is necessary when the risks to the fetus from a hostile intrauterine environment are greater than the risks of severe neonatal problems, including respiratory distress, even if the fetus is preterm. Amongst the unfavorable intrauterine environment is maternal hyperinsulinemia and insulin resistance occurring in diabetic patients. Hyperinsulinemia delays lung maturation by inhibiting surfactant proteins thus predisposing to respiratory distress in the neonate. **(Kristensen *et al.*, 2005; DeRoche *et al.*, 2002)**

Despite the considerable improvement in neonatal care, the morbidity for respiratory complications such as respiratory distress syndrome (RDS) in the infants born to diabetic mothers is considerable, as is the financial burden of the resulting care. **(E.G. Livingston *et al.*, 1995)** There has been a long-standing debate regarding the effect of maternal diabetes on FLM. Others have challenged the concept that, gestational age rather than overt diabetes is likely the most significant associated factor with respiratory distress. **(Berkowitz *et al.*, 1996; Kjos *et al.*, 1990)**
