ABSTRACT

Sahar Ahmed Abd El-Rehim. The reproductive performance of ewes fed rations containing different nitrogen sources. Unpublished Master of Science, University of Ain Shams, Faculty of Agriculture, Department of Animal Production 1997

Twelve Suffolk Ossimi crossbred ewes were used in this study. They were divided into three groups received three different rations: control ration (control group), 40 % ammoniated corn stover containing ration (ACS group) and 10 % broiler litter containing ration (BL group). Experimental period included 2 months preconception and 5 months pregnancy. Plasma levels of total protein, albumin, albumin/globulin ratio . urea . GOT and GPT were not influenced by dietary treatments but influenced by months of treatment. Plasma level of globulin increased while alkaline phosphatase level decreased in response to broiler litter treatment. Mean length of estrous cycle was longer in ACS group than control group (16.67 versus 15.44 days), while m gestation length was longer in BL group than control group (152.25 carsus 148 days), litter weight at birth was not influenced by treatment and not correlated with the length of gestation. Conception rate was not influenced by treatment. while lambing rate decreased in both ACS and BL groups. Mean concentration of plasma progesterone increased in response to dietary treatments in cycling ewes but not in pregnant ewes. Twin pregnancies were higher in progesterone level than single pregnancies (11.76 versus 8.39 ng/ml) lambs Growth during the first five weeks of suckling period decreased in the BL group. Digestion coefficients for crude protein were 54.74, 58.33 and 54.72, for TDN were 57.79, 60.88 and 55.75, and for DCP were 7.7, 8.85 and 8.08 for the control, ACS and BL groups, respectively.

Key words: Suffolk Ossimi crossbred ewes - Reproduction - Blood contents - Progesterone - Broiler litter- Ammoniated corn stover.

ACKNOWLEDGEMENTS

Praise and prayerful thanks to ALLAH for everything. The author wishes to express her appreciation and gratitude to Prof. Dr S.O. Amin, Professor of Animal Physiology, Department of Animal Production, Faculty of Agriculture, Ain Shams University for her close supervision, guidance and valuable help in revising the manuscript.

As well, the author wishes to express her gratitude and deep thanks to Dr. F.A. Khalil, Associate Professor of Animal Physiology, Department of Animal Production, Faculty of Agriculture, Ain Shams University for suggesting the problem designing the work, guidance and valuable help in writing and preparing the manuscript.

I wish to express my sincere appreciation to Prof. Dr. I. Gomaa, Professor of Animal Nutrition, and deputy of Animal Production Research Institute for supervision encouragement, providing facilities for this study and giving sincere advice and valuable help.

Deep thanks are due to Dr. A. M. S. Abdel-Aziz, Assistant Professor of Animal Physiology, Department of Animal Production, Faculty of Agriculture, Ain Shams University for his supervision, help and encouragement.

Thanks are due to Dr. M.H. Yackout, Assistant Professor of Byproduct Department of Animal Production Research Institute.

Thanks are due to Dr. F.F. Abo-Ammo Researcher in the Animal Production Research Institute, Department of sheep and Goats Researchs Ministry of Agriculture.

Special thanks to all staff members of Animal Production Research Institute and Nubaria Experimental station for their help and encouragement

I am Special grateful to my family and my husband for their support and encouragement.
