INTRODUCTION

Pancreatitis remains an important surgical problem with considerable morbidity and mortality, its treatment is largely empirical and its pathogenesis poorly under stood.

Acute pancreatitis is a common surgical emergency with presentation varying from mild self limiting attack of abdominal pain to severe systemic upset and eventual death as a consequence of pancreatic necrosis (Gohnson 1995).

Chronic pancreatitis is an inflammatory disease of the pancreas characterized by destruction of its exocrine and endocrine tissue and their replacement by fibrous scar (Reber 1994).
