STATEMENT

This thesis is submitted to Ain Shams University for the degree of Master of Science in Civil Engineering.

The work included in this thesis was carried out by the author in the Department of Irrigation & Hydraulics, Ain Shams University, from September 1992 to September 1994.

No part of this thesis has been submitted for the degree or qualification at any other University or Institution.

Date : 19 / 10 / 1994

Signature : Hala

Name : Hala Abu EL Fath Badawy

ACKNOWLEDGEMENTS

The author wishes to express her appreciation and gratitude to her supervisors, Prof. Dr. Mohamed El-Niazy Hammad, Prof. Dr. Ahmed Fakhry Khattab, and Dr. Essam Aly Abd-El-Hafiz, for their continuous guidance and help throughout the completion of the present investigation.

She also wishes to express her thanks to all her colleagues at the Research Institute of Weed Control and Channel Maintenance for their help and cooperation during both the experimental work and the computer analysis. She is also indebted to both secretary and drawing office staff for typing the manuscript and for preparing the figures.

Last, but not least, the author is deeply grateful to her parents for their sacrifices, blessings and moral support.

ABSTRACT

During the last 40 years the design practice for earthen canals in Egypt was based on El-Difrawy, Molesworth, and Yenidonia regime equations. El-Difrawy equation was deduced for the regime of irrigation system before the construction of Aswan High Dam (AHD) and is valid for average solid suspension 1600 ppm.

As the regime of canals system in Egypt has substantially changed after the construction of AHD, El-Difrawy equation may not be valid any more and new design concept is needed.

Investigations were carried out in Egypt (Khattab et al. 1984, 1985, 1987) based on measurements on stable canals passing through cohesive soil with discharges from 2 to 200 m³/sec., where a series of design regime type equations were deduced. These equations have correlated the relationship between the flow parameters and the canal geometrical elements of water cross-section and the slope.

In a similar way the present study was suggested to investigate the modification of the regime theory to achieve a suitable design equations for canals passing through sandy soil to cover a wide range of discharges from 0.1 to 200 m³/sec. Field measurements were carried out in four stations on Ismailia, Port Said and Suez fresh water canals. Over 79 experiments were conducted during two years to follow up different water levels at maximum and minimum water requirements. To generalize the work, data of other investigators on sandy canals was also collected. All data

were analysed where four regime type equations were deduced. These equations can be used safely in designing canals in sandy soil conveying discharges from 0.1 to 200 m³/sec. More useful regime type equations were also deduced. Comparison between the obtained results and those by others investigators took place.

CHAPTER 4

ANALYSIS AND DISCUSSIONS

4.1 INTRODUCTION	109
4.2 DISCUSSION OF THE RESULTS	110

4.2.1 The Correlation Between the Water Cross- Section and the Discharge	111
4.2.2 The Relation Between the average depth "D" and the Discharge "Q".	113
4.2.3 The Correlation Between the Hydraulic Radius "R" and the Discharge "Q".	113
4.2.4 The Relation Between the Average Velocity "V" and the Value of (R'S)	116
4.2.5 Some Useful Equations	118
4.2.5.1 The relation between the wetted perimeter "P" and the discharge "Q"	118
4.2.5.2 The relation between the top water width "w _T " and the discharge "Q".	120
4.2.5.3 The relation between the hydraulic radius "R" and the average water depth "D".	122
4.2.5.4 The relation between the ratio of (B/D) and the discharge "Q".	122
4.2.5.5 The relation between the ratio of water cross section area to average depth (A/D) and the wetted perimeter "P"	125
4.3 APPLICATION OF DEDUCED EQUATIONS IN CANAL DESIGN	127
4.3.1 Design Procedure	129
4.3.2 Comments on the Solved Examples	135
4.4 GENERAL APPLICATION OF THE DEDUCED EQUATIONS AND RECOMMENDATIONS	136
4.5 LIMITATION OF THE DEDUCED EQUATIONS	139

4.6	COMPARISON BETWEEN THE DESIGN USING	141
	THE EQUATIONS OF THE PRESENT INVESTIGATION	
	WITH THOSE OF OTHER INVESTIGATORS	
4.7	FINAL COMMENTS ON OTHER INVESTIGATORS	149
	WORK WITH RESPECT TO THE PRESENT INVESTIGATION
