

**Cell proliferation , PCNA, Ki-67 and P53  
In acute leukemia**

Thesis  
Submitted for partial fulfillment of M.D  
In  
Laboratory haematology

By  
**Dr./ EHAB IBRAHIM EL DESSOUKY ABD EL KADER**

Supervised by

**Prof. Dr./ BASIMA MAHMOUD AHMED AL ESAWY**  
Professor of clinical pathology  
Ain Shams University

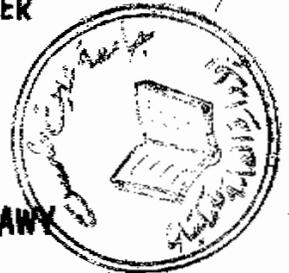

**Dr./ AFAF ABD EL AZIZ ABD EL GHAFFAR**  
Assistant Professor of clinical pathology  
Ain Shams University

**Dr./ HANAA MOHAMED AFIFY**

## ACKNOWLEDGEMENT

I wish to express my deep appreciation and gratitude to **Prof. Dr. Basima Mahmoud Al Esawy**, Professor of Clinical Pathology, Faculty of Medicine, Ain Shams University, for her valuable supervision, suggestions and continuous encouragement.

I would like to express special thanks and gratitude to **Dr. Afaf Abd El Aziz**, Assistant Professor of Clinical Pathology, Faculty of Medicine, Ain Shams University, for her meticulous supervision, sincere effort and outstanding assistance through every step of this work.

I would like to express my deep thanks and sincere appreciation to **Dr. Hanaa Mohamed Afify**, Assistant Professor of Clinical Pathology, Faculty of Medicine, Ain Shams University, for her supervision, valuable observation and generous support.

I would like to express my deep thanks and sincere appreciation to **Dr. Mohamed Amin Mekawy**, Assistant Professor of Clinical Pathology, Faculty of Medicine, Ain Shams University, for his supervision, great and sincere help and effort during this work.

## List of abbreviations

- (AML) acute myelogenous leukemia
- (APAAP) the alkaline phosphatase-antialkaline phosphatase complex
- (APC) The anaphase-promoting complex
- (ATL) adult T-cell leukemia
- (AUL) acute undifferentiated leukemia
- (BM) bone marrow
- (B-PLL) B-cell prolymphocytic leukemia
- (BrdU) bromodeoxyuridine
- (CDKs) Cyclin-dependent kinases
- (CKIs) cyclin-dependent kinase inhibitors
- (CLL) Chronic Lymphocytic Leukemia
- (CML) chronic myeloid leukemia
- (ER) endoplasmic reticulum
- (FAB) French American British
- (FCM) flow cytometry
- (FFA-1) Foci forming activity 1 protein
- (IdUrd) iododeoxyuridine
- (LDT) lymphocyte doubling time
- (LI) labeling index
- (MAb) monoclonal antibody
- (MDSs) myelodysplastic syndromes
- (ML) malignant lymphoma
- (NHL) non-Hodgkin's lymphoma
- (PBMC) peripheral blood mononuclear cells
- (PBS) Phosphate Buffer Saline
- (PCNA) proliferating cell nuclear antigen
- (PCNA-S) S-phase specific PCNA
- (PE) phycoerythrin
- (PI) propidium iodide
- (pol) polymerase

- (pRB) The retinoblastoma tumor suppressor protein
- (RF-C) replication factor C
- (RFC) replication factor C
- (RPA) replication protein A
- (SDS-PAGE) sodium dodecyl sulfate polyacrylamide gel electrophoresis
- (SPF) S-phase fraction
- (SV 40) simian virus 40
- (T-ag) tumor antigen
- (Tpot) potential tumour doubling time
- (TSGs) tumor suppressor genes
- (wtp53) wild type p53
- (ALL) acute lymphoblastic leukemia
- (ANLL) acute nonlymphoblastic leukemia
- (cip 1) cyclin interacting protein 1
- (ERCC3) excision repair protein
- (G1) (gap 1) phase
- (G2) (gap 2) phase
- (GADD45) growth arrest and DNA damage 45
- (kb) kilobases
- (KD) kilodalton
- (MPF) the M-phase promoting factor
- (RF-A) replication factor A
- (S) (synthetic) phase
- (UV) ultraviolet

# INTRODUCTION

---

## **Introduction:**

Actively dividing cells produce a number of unique proteins that may serve as useful antigenic markers in immunologic studies of cellular proliferation. The Ki-67 monoclonal antibody, recognizes one subprotein that is present only in the nucleus of cycling cycle but is absent in resting cells (*Gerdes et al , 1984*). Ki-67 is used as a tool in evaluating growth fractions and prognostic significance in haematological malignancies such as non Hodgkin's lymphoma (*Gerdes et al , 1987*) and acute leukemia (*Falini et al , 1988*).

Antibodies to proliferating cell nuclear antigen (PCNA) were detected in some patients with systemic lupus erythematosus, they reacted with a nuclear antigen expressed predominantly by proliferating cells such as cultured cells and mitogen-transformed cells (*Miyachi et al , 1978*).

The function of proliferating cell nuclear antigen (PCNA) in DNA replication and repair is to form a sliding clamp with replication factor C (RF-C) tethering DNA polymerase  $\delta$  or  $\phi$  to DNA. In addition, PCNA has been found to interact directly with various proteins involved in cell cycle regulation (*Schurtenberger et al , 1998*).

PCNA has been found in all phases of the cell cycle in actively proliferating cells. Thus it has been found to be a useful marker for detecting proliferating cells in solid tumours and identifying blast transformed cells in patients with leukemia (*Takasaki et al , 1984*).

P53 is a nuclear phosphoprotein encoded by a gene mapped on the short arm of chromosome 17 (*Isobe et al , 1986*). It is usually expressed at low levels and has a short half-life (only 6 minutes in the spleen) (*Gerdes et al , 1984*).

---

Mutant p53 expressed in many types of carcinoma lacks an inhibitory function on cell growth, but its role has been unclear (*Kurose et al., 1995*).

The p53 tumour suppressor protein is a potent transcription factor. p53 is latent in cells and can be activated in response to signals arising from a range of stresses including DNA damage, hypoxia, nucleotide depletion, viral infection and cytokines. Activation of p53 leads either to cellular growth arrest at the G1/S or G2/M transitions of the cell cycle or to programmed cell death (apoptosis) (*Meek, 1997*).

Although the investigations of Ki-67 and PCNA have suggested that both nuclear antigens are simple and fast markers of the proliferating compartment of human tumours, very little is known about the relationship between Ki-67 and PCNA expression of any given human cell subset (*Landberg et al., 1990*).

# AIM OF THE WORK
