Dr. H. M. Said

EXAMINERS COMMITTEE

Name , Title & Affiliation	Signature
1- Prof. Dr. E. El Sharkawi Consultant Engineer	
2 - Prof. Dr. S. El Debeiki Electrical Power , Machines Dept. Ain Shams University	
3- Prof. Dr. A. Nosseir Head of the Electrical Power , Machines Dept. Ain Shams University .	
4- Dr. M. Awad Chairman of North Upper Egypt Zone Egyptian Electricity Authority	

STATEMENT

This dissertation is submitted to Ain Shams University for the degree of Master in Electrical engineering .

The work included in this thesis was carried out by the author . No part of this thesis has been submitted for a degree or a qualification .

ACKNOWLEDGEMENT

The author is greatly honored to express her sincere and deep gratitude to professor Dr. A. Nosseir , chairman of the Electrical power & Machines Department , Faculty of Engineering , Ain shams university , for giving her the privilege of working under his supervision . She is deeply thankful for his continuous encouragement and valuable guidance .

Special thanks are due to prof. Dr. A. Soliman who supervised the work at its early stages for his continuous help & guidance .

The author wishes to express her deep gratitude to Dr. M. M. Awad , chairman of the North upper Egypt Zone , EEA for his continuous support , unfailing discussions and valuable instructions . His continuous advice was always stimulating and especially essential to complete his work .

The author is sincerely grateful to Dr. H. M. Said , the resident engineer for Ayoun Moussa power plant project , for his kind assistance continuous help and precious advice .

Finally , deep appreciation is expressed to all colleagues in the Egyptian Electricity Authority (EEA) in particular the staff of both the extra high voltage research center and the central chemical laboratory , for their cooperation and help in carrying out the tests and measurements .

Electric Power and Machines Department .

**Diagnostic Methods For Determining
Life Time Of Power Transformer
And Its Preventive maintenance
By
Eng. Nahed Ahmed I. Abu Higgy
For
The M. SC. Degree**

ABSTRACT :

Some methods are used to diagnose the transformer status such as partial discharge , short circuit reactance , low voltage impulse , dielectric strength . Oil analysis and chromatographic gas analysis are also used .

Some investigators defined the approximate gas concentration levels as safe , caution or fault levels .

The present investigation contains a complete survey of the power transformers existing in the Egyptian unified power grid . Samples from those transformers were selected . Gas in oil analysis were carried out over a period of two years . The dielectric strength and dissipation factor were also measured . A test model for accelerated ageing of oils was constructed to define the characteristics of oil after ageing . The acceptable ratio of mixing different oils can be determined by such model .

Some of the conclusions are :

- The forced outages in Egypt are relatively high and monitoring is important .
- The monitoring can be done by electric measurements and gas in oil analysis periodically .
- It is recommended that a caution level of some dissolved gases should be defined according to the local condition of operation .
- Gas in oil analysis can be used to define the type and place of the fault in a transformer .
- Accelerated ageing tests are essential to study the effect of ageing on the insulation and cooling efficiency of oil .

The thesis includes five chapters . Chapter one is an introduction to the present work . Chapter two is a review of the previous work related to the subject . Chapter three includes the testing technique and the details of the test circuit . Chapter four contains the test results and their analysis . chapter five presents the summary , conclusions and some suggestions for future work .

TABLE OF CONTENTS

LIST OF FIGURES

CHAPTER ONE

INTRODUCTION	1
--------------------	---

CHAPTER TWO

PREVIOUS WORK IN THE FIELD OF POWER TRANSFORMER STATUS DIAGNOSIS

2.1 GENERAL	6
2.2 INSULATION OF POWER TRANSFORMERS	7
2.3 TRANSFORMER OIL	9
2.3.1 Physical Properties	9
2.3.2 Chemical Properties	11
2.3.3 Electrical Properties	13
2.4 AGEING OF TRANSFORMER INSULATION	17
2.5 CRITERIA FOR CHECKING THE INSULATION CONDITIONS OF TRANSFORMERS	18
2.6 THE PRESENT STATE OF ART AND OBJECTIVES	48

CHAPTER THREE

TESTING TECHNIQUE

3.1 GENERAL	51
3.2 THE TEST SPECIMEN	52

3.2.1 Specimens from High Voltage Transformers -----	53
3.2.2 Specimens from Extra High Voltage Transformers ---	54
3.2.3 Modeling -----	54
3.3 METHODS OF SAMPLING -----	55
3.3.1 The sampling equipment -----	56
3.3.2 Sampling Procedure -----	57
3.4 TEST EQUIPMENT AND MEASURING CIRCUITS -----	60
3.4.1 Measuring the Gas Content -----	60
3.4.2 Dielectric Tests -----	62

CHAPTER FOUR
MONITORING AND DIAGNOSIS OF
POWER TRANSFORMER STATUS IN SERVICE

4.1 GENERAL -----	66
4.2 STATISTICAL ANALYSIS OF POWER TRANSFORMER FAILURES IN EGYPT -----	68
4.2.1 The Number of Outages -----	69
4.2.2 The Outage Time -----	72
4.2.3 Classifications of Forced Outages -----	73
4.3 FIELD INVESTIGATION ON MONITORING OF POWER TRANSFORMERS -----	77
4.3.1 Dielectric Measurements -----	78
4.3.2 Dissolved Gas in Oil Analysis -----	80

4.4 CHARACTERISTICS OF NEW OILS AND MIXING OF TRANSFORMER OILS -----	89
4.4.1 Effect of Ageing on Dielectric Properties of Oil -----	90
4.4.2 Effect of Ageing on the Cooling Efficiency of Oil -----	92
4.4.3 Determination of the Percentage of Mixing Oils -----	94
4.5 DIAGNOSTIC METHODS OF POWER TRANSFORMER STATUS	95
4.5.1 Diagnostic During Normal Operation -----	96
4.5.2 Diagnosis of Types of Fault -----	97

CHAPTER FIVE

GENERAL CONCLUSIONS AND SUGGESTION FOR FUTURE WORK

5.1 SUMMARY -----	101
5.2 CONCLUSIONS -----	105
5.3 SUGGESTIONS FOR FURTHER INVESTIGATIONS -----	108

CHAPTER ONE

INTRODUCTION

During the recent years , diagnostics and maintenance of equipment for power generation and transmission has become more and more important . The reason is that in the electric power industry , economy and quality of power supply have become vital issues . The world - wide decrease in economic growth makes replacements of equipment more difficult and necessitates a higher availability of existing equipment . This in turn requires an improved knowledge on the current condition of such equipment which can be provided only through reliable diagnostic techniques .

The power transformer is one of the most important member in any electrical network . The reliability of the network depends mainly on the availability of equipment , in particular the power transformer . Beside the disturbance caused by transformer failure , an economical overview has to be considered with respect to the shortage of power supplied to the consumers .

The operational behavior of a transformer is determined by the technical know-how of the designer , and achieved by expertise in manufacture . But to ensure that such behavior is maintained in operation , proper servicing and maintenance is required .

The costs for such servicing must be based on a safe operation throughout the life of the transformer , on the requirements laid down for a reliable supply of power , and on economy . Furthermore , it must also be possible for a correct determination of the operational reliability and the maintenance requirements to be made by less qualified personnel . Ideally , what is required is a series of tests which can be carried out in the field , fulfilling simple criteria , and / or lead to reproducible results .

Materials used in the manufacture of transformers gradually undergo changes in their structure which reduce their ability to withstand stress : this is true in particular for the insulation system , whose properties deteriorate under the influence of temperature , humidity , ingress of oxygen , vibrations and mechanical stress , and finally break down completely . A lifetime of approximately 30 years is generally presumed for power transformers . For this reason it is important to ensure that no unexpected ageing processes develop during the life of the transformer , through over stressing or insufficient maintenance . On the other hand , natural ageing which is unavoidable in service must not be allowed to lead to undesired system failure .

The most important of those components which produce ageing in the transformer are the paper used for conductor insulation , the transformer board insulation , insulating oil , on - load and off - load tap-changers and bushings .

Nevertheless it should be pointed out that the reliability of accessories is most important for the availability of transformers . Protection and control devices must be

carefully chosen therefore to prevent unwanted interruptions during service and regular switch off operations for the sole purpose of supervision or replacement of such auxiliary equipment .

An important prerequisite for the operational safety of a transformer is the purity and the dielectric strength of its oil . Impurities are mainly foreign bodies , parts of the solid insulation , frame , and gaskets used in construction which have dissolved in the oil . Products of the ageing of the oil itself are also found to be present . Furthermore the oil retains information on damaging processes occurring within the transformer (local hot-spots , electrical discharges) , in which gases , caused by the breakdown of the solid insulation , or by degradation of the oil are released and dissolved in the oil .

Monitoring of power transformers can be achieved by different methods . The dissolved gas in oil analysis (DGA) is the simplest , reproducible , cheaper and effective method . Investigators all over the world used this method long time ago to diagnose the status of transformer .

Users and manufacturers were using the DGA in detecting the faults (type , severity and location) inside any faulty transformer . In the present study it is suggested to use this method as a tool to define the status of transformer during service conditions .
