

Effect of Time from Venepuncture and Anticoagulant Choice on Platelet Count and Indices

Thesis submitted for partial fulfillment of the Master
Degree in Clinical and Chemical Pathology

Presented by

Dina Aziz A. Khattab
M.B., B.Ch., 1994
Ain Shams University

Under the supervision of

PROF. DR. NEHAJET M. AZMY ABDEL KERIM
Professor of Clinical and Chemical Pathology
Faculty of Medicine-Ain Shams University

PROF. DR. SALWA M. AMIN ABOU EL HANA
Professor of Clinical and Chemical Pathology
Faculty of Medicine-Ain Shams University

DR. MOHAMED AMIN M. MEKKAWY
Lecturer of Clinical and Chemical Pathology
Faculty of Medicine-Ain Shams University

FACULTY OF MEDICINE

1997

Dedication.....

to the person who inspired me all
my life, sacrificed a lot and received
very little; to whom words are not
enough to express any
gratification.....

Mum,

Thank you so much for everything!!!

Acknowledgment

*My deepest gratitude and sincere feelings are to be expressed towards Prof. **Nehaïet Abdel Kerim**, who brought this work to light and guided me all through the way. Without her constant encouragement and enthusiastic approach this thesis would not have ended fruitfully. She provided valuable and constructive criticism and was continuously following and reviewing my work till the end.*

*Many thanks to Prof. **Salwa Abou El Hana** for her aid and directions in this work especially her final contribution to it's success.*

*I am thankful to Dr. **Mohamed Mekkawy** for his advise and collaboration.*

*Very special appreciation goes to Prof. **Tarif Sallam**, whose kind advise, constant support and beneficial remarks were very much inspiring and added a lot to this study. To him I owe a great debt, his creativity, directions and guidance were always up to point, while his prompt decisions were invaluable.*

Abstract

This study was performed on 41 apparently normal subjects who were not on any medications affecting platelet parameters nor suffering from hematological disorders. PC, MPV, Pct and PDW were estimated on an electronic counter using 2 routine anticoagulants in hematological practice, namely Na₃ citrate (9:1) and K₂ EDTA (50u, 100u, 200u) over a 24 hour period (at zero time, 1,2,3 and 24 hours). PC in citrated samples showed a highly significant decrease all through the tested time, due to stickiness of platelets to the wall of the tube, while in EDTA 50u and 100u insignificant decrease in count was observed all through the tested period. Concerning MPV measurements, these showed insignificant decrease in citrated samples, while with EDTA a highly significant increase over time was detected in the 3 different concentrations due to platelet shape changes from discoid to spherical. On the other hand, Pct showed a significant progressive decrease in citrated samples which can be explained by the associated decrease in count values, while EDTA 50u and 100u had insignificant effect on Pct levels. Values of PDW revealed a significant decrease in all concentrations of EDTA with a peak at 3 hours in 50u samples and at 24 hours in 100u samples, due to the homogenous increase in MPV recordings. As regards citrate, insignificant decrease was obvious all through the tested period. Finally EDTA 50u and 200u proved to have a better stability on the 4 platelet parameters than EDTA 200u. Significant inverse correlations were detected

between PC and MPV in both EDTA 50u and 100u, while EDTA 200u showed no significant correlation. A significant correlation was detected between MPV and PDW in the above 2 concentrations. Student's paired t-test was performed for all the values obtained for statistical analysis. Thus, we conclude from the study that EDTA 50u and 100u are the best anticoagulants for platelet parameter estimation, considering 0 time to be the optimal time interval for readings.
