ACKNOWLEDGEMENT

Ever since I started this work I felt I was surrounded by a non-exhaustible source of caring, understanding and supporting guidance. It was a great pleasure to acknowledge my indebtedness to all those who make this thesis possible and I hope this would be considered as a personal "thank you" to each individually.

I wish to express my thanks and profound gratitude to Professor **Ahmed Okasha**, Professor of Psychiatry at Ain Shams University, to whom I am deeply indebted for all the inspiring guidance, valuable supervision and help. Thanks are also due to him for providing me with the most up to date references related to my topic.

I am grateful to Professor **Zeinab Bishry**, Professor of Psychiatry at Ain Shams University for her kind help, encouragement, great support and valuable time she devoted generously throughout the whole work.

My sincere appreciation to Professor **Afaf Hamed**, Professor of Psychiatry at Ain Shams University for giving me the chance of working under her supervision and for thorough and objective directions ever since I started to choose the topic and plan for it. Also, I am indebted for her teaching me the assets of precision, clarity and simplicity.

I am eternally grateful to Dr. **Safia Effat**, Assistant Professor of Psychiatry at Ain Shams University, for her scrutiny, valuable comments, suggestions, and her deep interest in the work. She has generously provided me with continuous assistance and advice althrough the work. Her cooperation and

meticulous revision were tremendous, that without which the study would have not been completed.

Acknowledgement is also made for the great effort given by Dr. **Susan El Kholi** in choosing suitable instruments and teaching me how to apply many of them.

I wish to express particular gratitude to all my colleagues who have provided me support .

Lastly, I would like to appreciate and thank all patients who agreed to participate in this work, and without their cooperation this work would not be accomplished.

Manal Fouad

ABSTRACT

Children of depressed mothers are considered at high risk for development of psychopathology. The impact of maternal depression is studied within a large framework. Characteristic schemata of depressed mothers-including behavioral, emotional and cognitive patterns-can affect mother-child interactions. The resulting harsh child management practices and consequent insecure mother-child attachment are reflected on those children. Not only maternal psychiatric illness which has deleterious effect on the children, but also, maternal physical illness is suggested to do so.

Current study is designed to assess the effect of chronic depressed mothers versus diabetic mothers on the mother-child system as well as the emotional state and cognitive functions of children. This is carried out in comparison to normal control group of mothers.

Sample comprises three groups of mothers:

1- Study group consists of 30 depressed mothers suffering of chronic or recurrent depressive disorder of more than 2 years duration.

2- Medical control group consists of 25 mothers having diabetes mellitus of at least 2 years duration.

3- Normal control group consists of 32 normal volunteer mothers.

The three groups of mothers have the following inclusion criteria:

1- Maternal age is ranging between 25-45 years.

2- Every mother has at least one child aging 8-14 years.

Diagnosis of depressed mothers was based on ICD-10 Diagnostic Criteria for Research using ICD-10 symptom checklist.

Both diabetic and normal control groups are subjected to General Health Questionnaire for exclusion of psychiatric morbidity and those who score 7 or more are excluded.

All mothers of three groups were subjected to Parenting Stress Index for assessment of mother-child system. It is a newly applied instrument in Egypt, that has been translated by author and one of the supervisors. Reliability of translation is statistically highly significant.

Children of the three groups are subjected to Child Depression Inventory, Children Anxiety Scale, Junior Eysenck Personality Questionnaire "Neurotic Subscale", Luria-Nebraska Neuropsychological battery "Intellectual Processing Scale" & Computerized test "Train the Brain" for Reaction Time and Discrimination.

Results of the study have shown statistically non-significant difference between depressed and diabetic groups, while, both are statistically significantly different from normal control group. Other results were further discussed.

Key words: maternal depression – children at risk – parental stress index – child depression
