بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

Acknowledgement

*I would like to express my sincere and deepest gratitude to my supervisor Prof. Dr. **GALILA MOHAMED MOKHTAR**, Professor of Pediatrics, Faculty of Medicine, Ain-Shams University, for her marvelous supervision, meticulous revision and valuable guidance. Her valuable knowledge and stimulating suggestions were of great help in performing this work.*

*I would like to express my deepest gratitude to Dr. **NAYERA ISMAIL** , Lecturer of Childhood Studies, Institute of Postgraduate Childhood Studies, Ain-Shams University.*

*All thanks to Dr. **IBRAHIM ATEF**, Fellow of Obstetrics & Gynecology, Ain-Shams University*

Arabic Summary	---

List of Abbreviations

CIN	Cervical Intraepithelial Neoplasia
CPRV	Cottontail Rabbit Papillomavirus
DNCB	Dinitrochlorobenzene
EV	Epidermodysplasia verruciformis
FEH	Focal Epithelial Hyperplasia
HPV	Human Papillomavirus
IFN	Interferon
ORF	Open Read Frames
PIN	Penile Intraepithelial Neoplasia
PML	Progressive Multifocal Leukoencepalopathy
PV	Papillomavirus
RBL	Retinoblastoma - Gene Product
RRP	Recurrent Respiratory Papillomatosis.
SADBE	Suicic Acid Dibutyl Ester

List of Tables

1. Disease induced by each subfamily	5
2. Diseases mechanisms of each subfamily	6
3. Functions assigned to the papillomavirus, open-reading frames	13
4. The known HPV types	15
5. Distribution of HPV types by the degree of genetic relatedness	20
6. Epidemiology of HPV	28
7. HPVs associated with occurring cancers	29
8.. Association of HPV types to morphology and location of skin warts	53
9. Major clinical association of mucosal HPVs	56
10. Laboratory diagnosis of HPV infection.	96
11.. Treatment modalities for warts,	101

INTRODUCTION
AND
AIM OF THE WORK

INTRODUCTION AND AIM OF THE WORK

Introduction :

Human papillomaviruses (HPVs) are widespread, sexually transmitted agents with an increasing prevalence. They are associated with a significant risk of genital carcinoma in infected women. Because they can be transmitted to the fetus before or during birth, they impose a risk factor to the infant born to the infected woman. (Steinberg, 1988). It is generally anticipated that maternal genital HPV may serve as a HPV reservoir (Lindeberg and Elbrond, 1990). HPV can be transmitted in utero through amniotic fluid (XU et al., 1995). Further studies suggested that neither cesarean section nor prepartum treatment of HPV lesions will protect against neonatal acquisition of HPV. Prevention of infection remains the best approach since diagnostic and therapeutic methods are suboptimal (Smith et al., 1991). Respiratory tract papillomatosis and juvenile laryngeal papillomas may develop as a result of perinatal vertical transmission of HPV (Downey and Luesly, 1995). The frequent non sexual transmission of genital papillomaviruses in children and the unexpectedly high association of children's condylomata with papillomaviruses (PVs) responsible
