*TO MY BELOVED HUSBAND
FOR HIS DEVOTION, SUPPORT
AND GUIDANCE*

HALA

ACKNOWLEDGEMENTS

I would like to express my utmost gratitude to my eminent Professor Dr. Toson A. Morsy, Professor and Head of the Parasitology Department, Faculty of Medicine, Ain Shams University, for his continuous encouragement, guidance and support.

I would like to express my deepest gratitude to Professor Dr. Laila M.A. El Okbi, Professor of Parasitology, Faculty of Medicine, Ain Shams University, for giving her time, effort, and experience to complete this work. I wish to thank her for her kind supervision, continuous encouragement, and helpful advice throughout the work.

I am particularly indebted to Dr. Mohamed A.R. Sarwat, Assistant Professor of Parasitology, Ain Shams University, for his faithful supervision, honest assistance, continuous guidance, and trustful help during this work.

I am especially grateful to Dr. Mahira H.M. El Sayed, Lecturer of Dermatology and Venereology, Faculty of Medicine, Ain Shams University, for her honest supervision, valuable advice and support during this work.

I am grateful to all my professors and colleagues at the Parasitology Department, Faculty of Medicine, Ain Shams University, for their encouragement and also for all the staff members at the Dermatology and Venereology Department, Faculty of Medicine, Ain Shams University for the facilities they offered to perform this work.

Hala Kamal Hassan El Deeb, 1993

INTRODUCTION

INTRODUCTION

Scabies is a very old contagious skin disease which is caused by the burrowing of a mite; *Sarcoptes scabiei* into the stratum corneum. It was mentioned in the ancient Egyptian "Papyrus" and was described by Ibnsina (Avacina) in his book "El Kanon" (*Kenawi et al., 1993*).

Scabies has a worldwide distribution with considerable prevalence in Egypt and it is one of the most common contagious parasitic diseases in Egypt (*Morsy et al., 1993*). In Egypt, scabies has been delt with by some, but not many, authors as Abo-Shady et al. (1985), Kenawi et al. (1993) and Morsy et al. (1993).

The occurrence of scabies epidemics every 15 years and the fluctuation in its incidence in various parts of the world is a real challenge to dermatologists, parasitologists, and veterinarians worldwide (*Alexander, 1984*).

Nowadays, scabies is considered as a serious public health problem in Egypt as claimed by Morsy et al. (1993).

MITES

Introduction

Mites belong to phylum arthropoda.

Arthropods are of medical importance because of the role they play in causing diseases either through the transmission of disease - producing agents, or the direct action through the inoculation of poison or through invading tissues. The five classes of arthropods categorized as being of medical importance are: (*Gordon and Lavoipierre, 1962*)

- | | |
|-----------------|--------------------------------------|
| 1. Chilopoda | Centipedes |
| 2. Pentastomida | Tongue worms |
| 3. Crustacea | Crabs, crayfish, and copepods |
| 4. Arachnida | Spiders, scorpions, mites, and ticks |
| 5. Hexapoda | Insects |

I. TAXONOMY OF MITES

Classification (*Beaver et al., 1984*)

Phylum	<i>Arthropoda</i> V. Siebold and Stannius, 1845
Subphylum	<i>Chelicerata</i> Heymons, 1901
Class	<i>Arachnida</i> Lamarek, 1815
Subclass	<i>Acari</i> Leach, 1817, (Ticks and Mites)
Order	<i>Parasitiformes</i> Reuter, 1909.
Suborder	<i>Gamasida</i> van der Hammen, 1968
Order	<i>Acariformes</i> Zachvatkin, 1952
Suborder	<i>Actinedida</i> van der Hammen, 1968
Suborder	<i>Acaridida</i> van der Hammen, 1968

Order *Parasitiformes* Reuter, 1909:

These are forms with 1 to 4 pairs of stigmata (a pair of respiratory spiracles) posterior to the coxae of the second pair of legs. The stigmata may be associated with simple encircling plates or grooves (peritremes) of varying length and complexity.

Suborder *Gamasida* van der Hammen, 1968:

These are mites possessing a small, toothless hypostome; eyes lacking; tracheae present, opening above or behind third coxa; opisthosoma without annulations or ventral furrows, and body often with leathery shield. Representatives are *Ornithonyssus bacoti* and *Dermanyssus gallinae*.

Order Acariformes Zachvatkin, 1952:

Mites without visible stigmata posterior to the coxae of the second pair of legs; some forms are with simple sensilla sensory organs or optically active setae and sensory structures located on the anterior portion of the prosoma (propodosoma).

Suborder Actinedida van der Hammen, 1968:

Forms having 3 to 5 segmented palps; propodosomal sensory organs often present. Some species with paired stigmata at or near the base of the chelicerae or on the propodosoma. Representatives are *Demodex folliculorum*, *Pyemotes tritici*, *Leptotrombidium* spp., and *Cheyletiella* spp.

Suborder Acaridida van der Hammen, 1968:

Forms having 2 segmented palps and no specialized sensory organs on the propodosoma. Respiration is through the integument so that there is no evidence of tracheae, stigmata, or peritremes. Representatives are *Sarcoptes scabiei*, *Tyrophagus* spp., *Acarus* spp., *Glycyphagus* spp., and *Dermatophagoides* spp.

So *Sarcoptes scabiei* (*S.scabiei*) mite is classified as follows:

Class	Arachnida
Order	Acarina
Suborder	Sarcoptiformes
Cohort	Acaridae
Family	Sarcoptidae
Subfamily	Sarcoptinae
Genus	<i>Sarcoptes</i>
Species	<i>scabiei</i>
