Evaluation of the Ponseti Method in Management of Idiopathic Clubfoot

A thesis submitted for fulfillment of M.D. degree of orthopaedic surgery

By

Ebeed Yasen Ibrahim Salem

M.Sc, orthopaedic surgery Cairo University

Supervised by

Prof. Dr. Yehia Tarraf

Professor of Orthopaedic Surgery
Head of pediatric orthopedic department, Faculty of
Medicine, Cairo University

Prof. Dr. Naguib Basha

Professor of Orthopaedic Surgery, Cairo University

Prof. Dr. Hisham Abdel Ghani

Associate Professor of Orthopaedic Surgery, Cairo University

Cairo University 2009

Acknowledgement

I wish to express my deepest gratitude to **Prof. Dr. Yehia tarraf**, Professor of Orthopedic Surgery, and head of pediatric orthopedic department, Faculty of Medicine, Cairo University for his kind supervision and valuable advice, without his support and wise council, this work would not have been completed.

My special thanks and deepest appreciation to **Prof. Dr. Naguib Basha**, Professor of Orthopedic Surgery, Faculty of Medicine, Cairo
University, who generously offered a lot of his precious time and interest.
His encouragement and guidance were a real help to accomplish my task.

I am also deeply grateful to **Prof. Dr. Hisham Abd El-Ghani**, Associate Professor of Orthopedic Surgery, Faculty of Medicine, Cairo University for his kind supervision, indispensable remarks and continuous support, assistance during all stages of this work and he offered me most of his time and effort as well as deep experience.

I can never express my gratitude and everlasting debt to my parents, who raised me to be who I am and how I am ...and I would also like to dedicate this work to my wife, without her support, patience, and loving care, I wouldn't have been able to do anything of what I did, so for that I will always owe her what I am and what I will become, forever.

Lastly, I would like to thank Dr. Mohamed Tag for all his help and support.

Abstract

From the 90 feet, there are 87 feet (96.6%) corrected with Ponseti technique, one foot (1.2%) was relapsed and needed extensive surgerical release and 2 (2.2%) feet didn't respond to Ponseti technique (early failure). Relapses had occurred in 13 feet, 10 feet had manipulation and recasting successfully, and 3 feet had recasting which failed to correct the recurrence, those underwent surgery on one foot, and two need TATT. The factors that are associated with high risk of recurrence were the non compliance with FAO, age at the presentation and the severity score before casting.

Key word:

Clubfoot – Cavus – Adductus – Varus – Equines - Ponseti method

Introduction

The clubfoot is one of the most common congenital deformities, and it is a complex three-dimensional deformity having four components; equinus, varus, adductus, and cavus. More than 100.000 babies are born world wide each year with congenital clubfoot. Eighty percent of the cases occur in developing nations. Untreated or poorly treated clubfoot is the most serious cause of physical disability among the congenital musculoskeletal defects (1).

The treatment of clubfoot has been controversial throughout the last 150 years but all would agree that the initial treatment of clubfoot should be nonoperative (1).

Although the early results of surgical release of clubfoot were encouraging, the long term results were unsatisfactory with the later development of foot pain and stiffness (2).

Several casting techniques have been described as the French method and Kite's method but finally most feet ended up in surgery with these two methods because more complications observed after over aggressive and improper casting treatment include pressure sores, flattop talus, rocker bottom deformity and residual deformity (2).

Sixty years ago, after careful study of the pathological anatomy and the biomechanics of the tarsal joints, dissection of clubfoot of stillborn babies and examination of serial histological sections of the fetuses, Ponseti developed a new conservative technique of manipulation followed by plaster cast applications that have yielded excellent results in majority of cases with minimal or no surgery. Popularity of his method has increased dramatically around the world (3).
