Flexural Behavior Of Reinforced Light Weight Concrete Beams Provided With Tension Bar Splices

BY
El-sayed Mohamed Anter Abdallah
Structural Engineer

A Thesis
Submitted in partial fulfillment for the requirements of the
Degree of Master of Science in civil engineering (Structural)

Supervised by
Prof. Dr. Omar Ali Mousa EL-Nawawy
Emeritus Professor of R.C. Structures
Faculty of Engineering
Ain Shams University

Dr. AMR H. ZAHER
Associate Professor,
Structural Engineering Department,
Ain Shams University

Dr. AMGAD A.TALAT
Assistant Professor,
Structural Engineering Department,
Ain Shams University

Faculty of Engineering
Ain Shams University
Cairo-2014

STATEMENT

This thesis is submitted to Ain Shams University, Cairo, Egypt, on March 2014 for the degree of Master of Science in Civil Engineering (Structural).

The work included in this thesis was carried out by the author in the Department of Civil Engineering (Structural Division), Ain Shams University, from September 2008 to March 2014.

No part of this thesis has been submitted for a degree or qualification at any other University or Institute.

Date : 16 / 3/ 2014

Name : El-sayed Mohamed Anter

Signature: *El-sayed*

**AIN SHAMS UNIVERSITY
FACULTY OF ENGINEERING**

APPROVAL SHEET

Thesis : Master of Science in Civil Engineering (Structural)
Student Name : El-sayed Mohamed Anter Abdallah
Thesis Title : Flexural Behavior Of Reinforced Light Weight Concrete Beams
Provided With Tension Bar Splices

Examiners Committee:

INFORMATION ABOUT THE RESEARCHER

Name: El-sayed Mohamed Anter Abdallah

Date of Birth: October 7th, 1984

Place of Birth: Fayuom, Egypt

Qualifications: B. Sc. Degree in Civil Engineering (Structural Eng.) Faculty of Engineering, 6 October University (2007).

Present Job: Structural Engineer

Signature: *El-sayed*

ACKNOWLEDGMENTS

First of all, I would like to thank God for every gift bestowed on me...

*Next, I would like to extend my warmest heartfelt gratitude to **all my family** who stood by me and supported me in every step of my life. I would like to deeply thank them and convey my sincere appreciation for their assistance, encouragement, support, understanding, and patience.*

*Moreover, I would like to express my sincerest appreciation to my advisors, **Prof. Dr. Omar El-Nawawy** and **Dr. Amro.H.zaher** and for their guidance, continuous, valuable guidance, and the investments, giving me the opportunity to be involved in such interesting research.*

*I would like to extend sincere thanks to my advisor, **Dr. Amgad** for providing the guidance necessary to complete this research and also for his constant encouragement, support, and friendship which was the motivating force that kept work on my thesis in force until completion. I would like to express my admiration and thanks for his loyalty and trustfulness.*

I would like to thank the Concrete Research Laboratory, Ain Shames University for supporting me during my research. I would like to thank those who helped and improved the means of casting and testing the samples. I am also grateful to those unmentioned others for contributing in countless ways to my writing and being interested in my research. To all of those contributors, I am most grateful..

I believe that I have given my utmost effort in developing this research as accurately and truthfully as possible. Moreover, I am surely personally responsible for the conclusions and opinions expressed here.

*Finally, I'd like to dedicate this work to my beloved **my wife** as a taken of appreciation... I would like to extend my warmest heartfelt gratitude to such an honored...I was really fortunate to receive the benefit of his spirit and intelligence.*

Abstract of the M.Sc. Thesis Submitted by

ENG / EL-SAYED MOHAMED ANTER

Title of the thesis

**Flexural Behavior Of Reinforced Light Weight Concrete Beams
Provided With Tension Bar Splices**

ABSTRACT

The flexural behavior of reinforced light-weight concrete beams was tested experimentally and theoretically evaluated in this study. The objectives of this research work could be summarized in the following points: Background for light weight concrete, the flexural behavior of reinforced light-weight concrete beams. LWRC was obtained through the use of polystyrene foam as a partial aggregate's replacement to reduce the concrete dry unit weight from 23.0 KN/m^3 to 18.0 KN/m^3 . Eight LWRC beams were prepared, casted and tested under four point loading up to failure. The main studied factors were; 1) the percentage of spliced reinforcement in the beams, (25%, 50 % and 100% of spliced reinforcement in maximum bending moment). ; 2) the effect of vertical stirrups in splice zones (no stirrups , 5 Ø8/m and 10 Ø 8/m) and 3) finally the effect of changing diameter of steel reinforcement bars (12mm bar diameter and 16 mm bar diameter). Seven light weight reinforced beams and one normal weight reinforced beam. Tested Beams with clear span of 3.0m and with a cross-section 20x40cm were casted and tested at Reinforced Concrete laboratory, Ain Shames University, the behavior of tested beams during loading up to failure and the tests results including the cracks pattern, the load deflection relation, and the mode of failure are presented and discussed. The obtained results show that tested beams with increasing percentage of splices reinforcement caused decreasing the deflection, steel strain and concrete strain increasing the failure load. Increasing percentage of stirrups caused decreasing the deflection and concrete strain and

increasing the failure load and steel strain. Increasing diameter bar caused decreasing the deflection, concrete strain and failure load and increasing the steel strain

. The thesis include eight beams was tested theoretically by Ansys program eight beams same the experimentally beams and one light weight concrete beam no splice in main reinforcement and another normal beam no splice in main reinforcement this two beams as a control beams. The results show that good acceptance by experimentally and theoretically study.
