1988

STATEMENT

This dissertation is submitted to Ain Shams University for the degree of Master of Science in Civil Engineering.

The work included in this thesis was carried out by the author in the Department of Structural Engineering, Ain Shams University, from December 1981 to September 1988.

No part of this thesis has been submitted for a degree or a qualification at any other University or Institution.

Date : 7/11/88

Signature : M. Omar

Name : Mohamed Omar Ahmed

Date: 7 / 11 / 1988

To My Dear Rana...

ACKNOWLEDGEMENT

ACKNOWLEDGEMENT

I would like to express my deepest gratitude and indeptness to Prof. Dr. Eng. Farouk El-Kadi, professor of Soil Mechanics and Foundations, Faculty of Engineering, Ain Shams University. He proposed the topic of this research and provided me with continuous support, invaluable advice and useful discussion during the process of this work.

I am truly appreciative of the help given to me by Dr. Fathalla El-Nahhas, associate professor of Soil Mechanics and Foundations. He helped me in preparation and reviewing the manuscript. His friendly guidance, professional suggestions and continuous support were so conductive to finish this work.

My deep thanks to Eng. Hussein Abdel-Fattah and Eng. Khaled Ali who offered me great help and sincere assistance through the computer works done in this thesis.

Special thanks to Dr. Wafaa Shehata, Dr. Iman Sadek and Dr. Amani Shalaby for their support and friendship. They helped me in preparing this work in its final form.

I would like to thank Mohamed Abdel-Hakim for his great effort in performing the drawings of this thesis. I am also thankful for the friendship of the members of Soil Mechanics and Foundations Engineering Department, Ain Shams University.

EFFECT OF RIGIDITY OF SUPERSTRUCTURE
ON CONTACT PRESSURE

M.Sc. Thesis in Civil Engineering
DEPT. OF Structural Eng., Ain Shams University
By
Mohamed Omar Ahmed Gamal El-Din Hussein Omar

ABSTRACT

Interaction of structures founded on isolated footings is greatly dependent on the rigidity of two elements, tie beams and overall rigidity of superstructure. Review of previous studies indicated that there is a lack of simple design methods and researches concerning evaluation of the real effect of tie beams for resisting differential settlements and consequently the benefits of utilizing tie beams in shallow foundations.

This thesis presents a parametric study for investigating the effect of rigidity of tie beams and superstructure on the calculated values of differential settlement of supports and consequently, their effect on the magnitude of applied contact pressure beneath foundation.

A BASIC computer program was specially coded and used on a microcomputer for this investigation. It was concluded that the rigidity of tie beams and superstructure has a major effect on minimizing the differential settlements between footings and also affects the contact pressure.

An analytical procedure is presented and can be used to calculate settlement, differential settlement and contact pressure, taking into consideration the effect of rigidity of superstructure elements.

KEY WORDS : Isolated footings, Tie beams, Semelles, Rigidity of superstructure, Contact pressure, BASIC, TURBO BASIC, CAD, Parametric study, Differential settlement.

Degree awarded: November 1988
Supervisor: Prof. Dr. Farouk Ibrahim El-Kadi.

TABLE OF CONTENTS

NOTATIONS

CHAPTER (1). INTRODUCTION.

1.1 General	1
1.2 Objective and Scope	3

CHAPTER (2). REVIEW OF PREVIOUS STUDIES.

2.1 Soil-Structure Interaction of Shallow Foundations.	9
2.2 Theory of Subgrade Reaction.	13
2.3 Analysis of Beams Resting on Elastic, Isotropic, Homogenous, and Half-Space Foundations.	19
2.4 Effects of Superstructure on Soil-Foundation Interaction.	33
2.5 Damping Effect of Ground Tie Beams.	38

CHAPTER (3). STATICAL MODELS AND PARAMETRIC STUDY.

3.1 Introduction.	45
3.2 Statical Models.	45
3.3 Outlines of Cases Under Investigations.	55
3.4 Computer Programs.	57

CHAPTER (4) RESULTS AND DISCUSSION.

4.1 Introduction.	61
4.2 Discussion of Results of Model 1.	62
4.3 Discussion of Results of Model 2.	71
4.4 Discussion of Results of Model 3.	96
4.5 Discussion of Results of Model 4.	126

4.6	Discussion of Results of Model 5.	134
4.7	Comparison Between Present Study and Previous Studies.	140
CHAPTER (5)	CONCLUSIONS.	142
REFERENCES		145
APPENDICES		
A:	Derivation of Bending Moments due to Differential Settlements.	152
B:	Derivation of Differential Damping Settlement due to Presence of Tie Beams.	158
C:	Main Systems and Samples of Results for the Cases under Investigations.	176
D:	Computer Programs.	215
ARABIC SUMMARY		

NOTATIONS

The following notations are those generally used in this thesis; other notations required for the purpose of the analysis will be mentioned following their appearance.

SYMBOL	REPRESENTS
P_{av}	: Average contact pressure.
E_s	: Young's modulus of elasticity of soil.
E_c	: Young's modulus of elasticity of foundation material.
S_o	: Original settlement without tie beams.
C_s	: Settlement influence coefficient.
D_s	: Depth of compressible layer of soil.
a & b'	: Dimensions of a footing.
S	: Damped settlement.
S^*	: Settlement Coefficient.
L	: Total length of tie beam.
C_b	: Coefficient of subgrade reaction.
$\bar{\sigma}$: Allowable contact pressure.
A	: Area of footing.
I_c	: Moment of inertia of cross section.
h	: Height of floor.
d	: Depth of tie beam.
b	: Breadth of tie beam.
ΔS	: Damped differential settlement.
ΔS_o	: Original differential settlement with no tie beam.
ΔS_t	: Theoretical differential settlement neglecting the

effect of adjacent footings.

ΔS_{eb} : Differential settlement choosing Winker's assumptions.

ΔS_{max} : Maximum differential settlement between any two points.

R.F. % : $R.F. = (\Delta S / \Delta S_o) \%$.

R.P. % : $R.P. = (1 - R.F.) \%$.

$\Delta \delta$ % : Percentage of variability of δ .

ΔS_1 : Damped differential settlement for first span.

ΔS_2 : Damped differential settlement for second span.

M or B.M. : Bending moment acting on tie beam.

n : Number of footings.

K_r : Relative rigidity factor.

m : Bending moment factor.

m_1 : Another bending moment factor.

n - 1 : Number of spans.

C.P. : Allowable contact pressure.

ΔR : Variability of reactions.

R.A.M. : Random access memory of computer.

R.O.M. : Read only memory of computer.

UNITS

The following units are used:

INTRODUCTION

CHAPTER (1)

INTRODUCTION

1.1 General:

Design of foundation must satisfy two essential deformation requirements, namely, the total settlement of the structure is limited to a tolerably small amount (depending on the type of superstructure) and the differential settlement of the various parts of the structure is minimized as much as possible to eliminate any structural damage. In several cases the minimization of differential settlement, is considered more important than limitations on uniform overall settlement.

In order to limit settlements, it may become necessary to use deep foundations to transmit the load to deeper, firmer layers.

However, if satisfactory soil directly underlies the structure, shallow foundations can be designed taking into account the deformation constraints.

Settlement of a structure is the result of the deformation of the supporting subsoil. It may be evidence of elastic deformation, volume change due to a reduction of the water content (consolidation) or general shear movement, or other factors as collapse of structural arrangements of soil particles (Scott, 1981).

Limiting the total settlement of a structure is frequently used as an indirect means of controlling the amount of differential settlement. For instance the Canadian Foundation
