

# BACTERIOLOGICAL SURVEY IN THE NEONATAL INTENSIVE CARE UNIT

## THESIS

Submitted in partial fulfillment for the requirement of the  
**M.Sc. Degree in Paediatrics**

By

**NAGLAA MOHAMED GALAL EL DEFRAWY**

M.B., B.Ch.

*Under the supervision of*

**PROF. DR. ABDEL KHALIK KHATTAB**

M.D., Ph.D. (Ed.), F.R.C.P. (Ed.), F.R.C.P. (Glasgow)

Professor of Paediatrics

Ain Shams University

*Assistant Supervisor*

**DR. AMIRA MOHAMED MOKHTAR**

Lecturer of Clinical Pathology

Ain Shams University

Faculty of Medicine

Ain Shams University

1992

بسم الله الرحمن الرحيم

سورة العلق ، الآيات ١-٥

*To. . .*

*My family*

*My husband*

*My daughter*

## ACKNOWLEDGEMENT

*I would like to express my deep thanks and gratitude to **Prof. Dr. Abd El Khalik Khattab**, Professor of Paediatrics, Ain Shams University, for his great support, guidance and patience.*

*I am very much obliged for his meticulous supervision and eminent help throughout the whole work.*

*My deep gratitude goes to **Dr. Amira Mohamed Mokhtar**, Lecturer of Clinical Pathology, Ain Shams University, for her remarkable effort and encouragement during the work of this thesis.*

*I would like to thank all my dear colleagues and nursing staff in the NICU and obstetric ward, Ain Shams University, without whose help this work would not be possible.*

*I am very much obliged to all the members of my family for their great support and help.*

## ABBREVIATIONS

AIDS	Autoimmune deficiency syndrome
Cl. tetani	Clostridium tetani
Coryne. diphtheria	Corynebacterium diphtheria
CS	Caesarian section
E. coli	Escherichia coli
F	Female
HIE	Hypoxic ischaemic encephalopathy
Hrs	Hours
ICU	Intensive care unit
IDM	Infant of diabetic mother
Ig	Immunoglobulins
M	Male
Myco. tuberculosis	Mycobacterium tuberculosis
NICU	Neonatal intensive care unit
NVD	Normal vaginal delivery
Obst. ward	Obstetric ward
OU	Obstetric unit
PET	Preeclampsic toxaemia

PMN	Polymorphonuclear leucocytes
PROM	Prolonged rupture of membrane
Ps. aeruginosa	Pseudomonas aeruginosa
RD	Respiratory distress
RDS	Respiratory distress syndrome
Resp. viruses	Respiratory viruses
S. aureus	Staphylococcus aureus
Staph. epidermidis	Staphylococcal epidermidis
Staph.	Staphylococcus
WBC	White blood cells

# ***Introduction***

## INTRODUCTION

The foetus and newborn are especially susceptible to generalized, sometimes overwhelming bacterial-viral and parasitic infections.

The newborn infants is susceptible because of immature cellular and humoral immune systems. Since newborns are so susceptible to infection, traffic in the nursery must be monitored and controlled.

Physicians, nurses, laboratory technicians, parents, students and anyone else authorized to enter the nursery and handle infant must wash their hands for three minutes with a germicidal soap and wear a clean gown. This procedure should be repeated before handling each infant (*Kempe et al.*, 1987).

Many patients within a paediatric intensive care unit are infected, mostly with community acquired infections. The outcome is generally better than that anticipated in neonatal intensive care units. However, infection continues to be associated with increased mortality when compared with those patients who remain uninfected (*Brown et al.*, 1987).

The diagnosis of sepsis in the neonate is a difficult task for those involved in neonatal care sepsis centres in the differential diagnosis of almost any sign of neonatal distress (e.g. apnea, bradycardia, respiratory problems, feeding intolerance, or temperature instability (*Kurlat et al.*, 1989)).

The risk of nosocomial infection in fullterm neonates cared for in well-baby nurseries can be minimized if the personnel adhere to fundamental infection control principles (*Goldmann*, 1989).

Neonates who require intensive care face a much greater risk of infection, particularly if they have very low birth weights. Such babies have seriously impaired host defenses, require prolonged hospital stays, and are exposed to a variety of intensive diagnostic and therapeutic procedures. They are extremely vulnerable to a wide range of nosocomial pathogens, including bacteria, fungi and viruses, many of which are frank opportunists. Although, it may not be possible to prevent all, or even most of these infections, careful attention to barrier precautions, adequate staffing, sound NICU design, and prompt care identification and controlling can substantially reduce the risk (*Goldmann*, 1989).
