EXAMINERS

Prof.Dr.SAAFAN ABDEL GOUAD SAAFAN

(Head of structural engineering departement, Ain Sams
University)

Prof.Dr.MOHAMED AHMED KASEM

(Head of Civil engineering departement, Monofeia
University)

Prof.Dr.AHMED ABDEL MENAEM KORASHY

Prof.of theory of structure, Faculty of Engineering,
Ain Shams University.

ACKNOWLEDGEMENTS

The author would like to express his deepest thanks, gratitude and appreciation to Prof.Dr.Eng.AHMED. A.E.M.KORASHY;Prof.of theory of structures, Faculty of engineering, Ain Shams University, for suggesting and supervising the work and for his constructive criticisms and his sincere co-operation and support through this work.

The author is fully indebted to Dr.Eng.MOSTAFA.K.ZIDAN; Assistant Prof. of theory of structures, Faculty of Engineering, Ain Shams University, for his supervision and guidance through this work, his suggestion of the problems. his follow up and his keen interest formed the back-bone of the study.

The author also wishes to extend his thanks to the staff of theory of structure department and computer center of Faculty Of Engineering, Ain Shams University, Cairo, for their contribution in the computation contained in this work.

TABLE OF CONTENTS

TABLE OF CONTENTS

INTRODUCTION1

CHAPTER (1) LITERATURE SURVEY

(1-1) Shear walls subjected to horizontal loads4
(1-2) Shear walls subjected to vertical loads9
(1-2-1) Solid shear wall10
(1-2-2) Pierced shear wall12

CHAPTER (2) STRUCTURAL ANALYSIS OF COUPLED SHEAR WALL

SUPPORTED ON RIGID FRAME

(2-1) Introduction15
(2-2) Finite elements approach16
(2-2-1) Finite elements with rotational degrees of freedom17
(2-2-2) Derivation of the three degrees of freedom element stiffness matrix19
(2-2-4) The computer program22
(2-3) Frame idealization method29
(2-3-1) Derivation of the element stiffness matrix for the general frame element30
(2-3-2) The computer program36
(2-4) Comparative study between the frame idealization method and the plane stress finite element method..	36
(2-4-1) Geometry of treated examples37
(2-4-2) Discussion of results40

CHAPTER (3) THE EFFECT OF CURTAILMENT ON THE STRUCTURAL

 BEHAVIOUR OF COUPLED SHEAR WALLS

(3-1) Introduction50
(3-2) The composite action in coupled shear walls.....	51
(3-3) Slenderness of the supporting columns53
(3-3-1) Geometry of studied curtailed coupled shear wall53
(3-3-2) Symboles used in the comparative study.....	54
(3-3-3) Representation of results55
(3-3-4) Discussion of results57
(3-3-4-1) Deflection57
(3-3-4-2) Internal forces in the wall64
(3-3-4-3) Moment in the connecting beams65
(3-3-4-4) Stress in the columns66
(3-4) Opening position66
(3-4-1) General66
(3-4-2) Geometry of studied walls67
(3-4-3) Symboles used in the comparativ study.....	69
(3-4-4) Representation of results71
(3-4-5) Discussion of results71
(3-4-5-1) Deflection71
(3-4-5-2) Internal forces and stresses in columns	
(3-4-5-3) Internal forces in the wall79
(3-5) The level of curtailment80
(3-5-1) General80
(3-5-2) Configuration of studied curtailed walls....	81

(3-5-3) Representation of results85
(3-5-4) Discussion of results90
(3-5-4-1) Deflection90
(3-5-4-2) Stresses in columns90
(3-5-4-3) Internal forces in the wall91
(3-6) The number of soft stories92
(3-6-1) General92
(3-6-2) Configuration of studied curtailed walls...	93
(3-6-3) Symboles used in the parametric study.....	93
(3-6-4) Representation of results96
(3-6-5) Discussion of results101
(3-6-5-1) Deflection101
(3-6-5-2) Internal force in the supporting columns	
(3-6-5-3) Internal forces in the wall103
(3-7) The height of the wall104
(3-7-1) General104
(3-7-2) Configuration of studied walls104
(3-7-3) Representation of results107
(3-7-4) Discussion of results107
(3-7-4-1) Deflection107
(3-7-4-2) Internal forces109
(3-8) Double-bay curtailed coupled shear wall110
(3-8-1) General110
(3-8-2) Configuration of studied wall110
(3-8-3) Symboles used in the comparative study.....	112
(3-8-4) Discussion of results113
(3-8-4-1) Deflection113
(3-8-4-2) Stress in columns115

(3-8-4-3) Internal forces in the wall	117
CHAPTER (4) THE INTERACTION OF CURTAILED WALL WITH OTHER	

STRUCTURAL ELEMENTS.	

(4-1) Introduction	120
(4-2) Curtailed shear wall-frame interaction	121
(4-2-1) Simplified idealization of the shear wall-	
frame system	121
(4-2-2) Lateral stiffness	123
(4-2-3) Models	126
(4-2-4) Studied parameters	129
(4-2-5) Representation of results	131
(4-2-6) Discussion of results	137
(4-3) Braced curtailed shear wall	139
(4-3-1) General	139
(4-3-2) Braced curtailed pierced shear wall.....	141
(4-3-3) Representation of results	144
(4-3-4) Discussion of results	150
(4-3-5) Braced curtailed solid wall	151
(4-3-6) Representation of results	153
(4-3-7) Discussion of results	156
CHAPTER (5) SUGGESTED SIMPLIFIED METHOD FOR THE ANALYSIS	

OF CURTAILED SHEAR WALLS SUBJECTED TO HORIZONTAL LOADS	

(5-1) Introduction	157
(5-2) SCHWAIGHOFFER and MICROY's method	158
(5-3) BRYAN STAFFORD's method	161
(5-3-1) General	161

(5-3-2) Modified moment of inertia163
(5-4) Suggested simplified method164
(5-4-1) Check the effeciency of the suggested simplified method166
(5-4-2) Results of the comparative study168
(5-5) Extending the suggested method to the un-symmetrical wall170
(5-5-1) New modification factor170
(5-5-2) Check the effeciency of the extended method170
(5-5-3) Results of the comparative study172
CAPTER (6) CURTAILED COUPLED SHEAR WALLS ON ELASTIC FOUNDATION	

(6-1) Introduction175
(6-2) Modulus of subgrade reaction176
(6-3) Finite beam on elastic foundation177
(6-4) Derivation of the element stiffness matrix for beam on elastic foundation180
(6-5) Computer program183
(6-6) First parametric study (effect of change of wall span)185
(6-6-1) Models of single and double bay curtailed shear walls185
(6-7) Discussion of the results189
(6-7-1) Single-bay shear wall subjected to vertical loads189
(6-7-2) Double-bay shear wall subjected to vertical load193

(6-7-3) Double-bay shear wall subjected to horizontal loads200
(6-8) Second parametric study (changing the properties of the substructure)207
(6-8-1) Types of investigated shear walls207
(6-9) Discussion of results212
(6-9-1) Single-bay shear wall subjected to vertical loads212
(6-9-2) Double-bay shear wall subjected to vertical loads221
(6-9-3) Double-bay shear wall subjected to horizontal loads223

INTRODUCTION

High rise buildings subjected to wind and / or seismic loads need certain structural elements to resist such loads. The most common used structural system in these buildings is the shear walls system. For many architectural purposes, a curtailment process for the shear walls may be executed in ground and lower stories to obtain large areas available for garages and office buildings. The curtailment process is the task by which the shear walls are replaced by frames.

The aim of the present thesis is to investigate the effect of the curtailment process on the structural behaviour of shear walls subjected to lateral loads. The behaviour of these curtailed shear walls when they are supported on elastic foundations is also examined. Three computer programmes are written especially for the analysis of such irrational walls.

The thesis contains six chapters and four appendices.

In the first chapter, some imperical equations used in evaluating the internal forces and stresses in curtailed shear walls subjected to both vertical and horizontal loads are presented.

The second chapter presents two different methods used

previously to analyze the curtailed shear walls. The first method uses the well-known technique of finite elements while the second one is the frame idealization method. Two computer programs are prepared to fit these two approaches. A comparative study was carried out on practical curtailed walls to check the correspondance between the results of both approaches.

The third chapter comprises a comprehensive parametric study to investigate the effect of the curtailment process on the structural behaviour of the walls. The following different parameters are included in the study:

- (a) the slenderness of the supporting frames's columns.
- (b) the openings position.
- (c) the curtailed level.
- (d) the number of curtailed stories.
- (e) the wall height.
- (f) the number of bays.

Chapter (4) deals with the curtailed shear wall-frame interaction in sustaining lateral loads. The behaviour of braced curtailed shear walls is also investigated.

In chapter (5) an approximate simplified method for the analysis of curtailed shear walls is presented. This method has the advantage of using standard plane frame computer programs to describe the structural behaviour of

such walls. The merit of the proposed method is judged by comparing its results with those of the more comprehensive methods through a comparative study on both symmetrical and un symmetrical walls.

The behaviour of curtailed shear walls supported on elastic foundations is the subject of chapter (6). The parameters affecting this behaviour, such as the wall geometry, the factor of soil subgrade reaction and the foundation rigidity, are examined. A computer program dealing with this study was prepared.

The comprehensive study carried out in the present thesis provides a wide practical base in the field of the predication of the structural behaviour of curtailed shear walls. Design curves are presented, conclusions are given and recommendations for future expansion are specified.

CHAPTER (1)

LITERATURE SURVEY

(1-1) Shear walls subjected to horizontal loads

The usefulness of walls in the structural planning of multistory building has long been recognized. When walls are situated in advantageous position in a building, they can be very efficient in resisting lateral loads originating from wind or earthquakes.

Different methods has been presented for the analysis of the shear walls subjected to lateral horizontal loads. In 1962, BECK¹, established the continuous medium method for analyzing symmetrical interconnected shear wall structures (Fig. (1-1-a)). In this method, the system of interconnecting beams is assumed replaced by a continuous medium with equivalent but distributed structural properties. A differential equations is written for the analogous structure and solved to determine the actions. In 1967,^{2,3} the previous method was extended by COULL, to be used in case of symmetrical as well as unsymmetrical interconnected shear wall using a family of curves for evaluating both the stress and the deflection along the wall height.

The second common method used in the analysis of shear wall, is the equivalent wide column frame method.
