## ***LIST OF FIGURES AND TABLES***

<b>I: FIGURES</b>		
<b><i>Fig. No.</i></b>	<b><i>Figure title</i></b>	<b><i>Page</i></b>
1	Graphic distribution comparing mean levels of vWF among all groups	100
2	Graph comparison between mean DBP of different. groups.	102
3	Graphic demonstration of differences of mean levels of glycated Hb in different.	104
4	groups Graphic demonstration of differences of mean levels of FBG in different. groups	106
5	Graphic representation of mean cholesterol level in all groups	108
6	Graphic representation of mean levels of STG in all groups	110
7	Graphic representation of mean levels of s.HDL in all groups	112
8	Graphic demonstration of the relation between protienuria & vWF in NIDDM	113
9	patients Graphic demonstration of the relation of glycated Hb level & vWF	114
10	Graphic demonstration of the correlation of FBG level & vWF	115
11	Graphic demonstration of the correlation of cholesterol level & vWF	116
12	Graphic demonstration of the correlation of STG & vWF	117
13	Graphic demonstration of the correlation of DBP & vWF	118
14	Graphic demonstration of the correlation of s.HDL & vWF	119

## II. TABLES

<i>Table No.</i>	<i>TITLE</i>	<i>Page</i>
1	Data of group I patients	93
2	Data of group II patients	94
3	Data of group III patients	95
4	Data of group IV control subjects	96
5	vWF levels in all studied groups	97
6	Mean & SD of vWF in all groups	98
7	Comparison between mean DBP of all groups	101
8	Comparison between mean levels among diabetic groups	103
9	Comparison between mean FBG of all groups	105
10	Comparison between mean cholesterol levels of all groups	107
11	Comparison between mean STG of all groups	109
12	Comparison between mean s.HDL of all groups	111
13	Correlation between vWF & level of protienuria	113
14	Correlation between vWF & level of glycated Hb	114
15	Correlation between vWF & FBG level	115
16	Correlation between vWF & s. cholesterol level	116
17	Correlation between vWF & level of STG	117
18	Correlation between vWF & DBP	118
19	Correlation between vWF & s.HDL	119

### **LIST OF ABBREVIATIONS**

vWF	von-Willebrand factor
DBP	diastolic blood pressure
Hb	hemoglobin
FBG	fasting blood glucose
STG	serum triglycerides
HDL	high density lipoproteins
IDDM	insulin dependent diabetes mellitus
NIDDM	non-insulin dependent diabetes mellitus

## ACKNOWLEDGMENT

I have been honored to have professor Dr. Omar Fathey, professor of Internal Medicine, and head of Hematology Oncology unit, at Ain-Shams University, to be my supervisor, he has been of utmost supreme guidance to me, starting from the choice of the work I was to carry out, throughout the period of the practical work providing me with priceless information, reflecting his huge magnitude of knowledge, which he offered so humbly.

Assistant professor Dr. Abd-el-Rahman Soliman, the assistant professor of Internal Medicine at Ain-Shams University, has given me much of his worthy time in guiding, following, correcting, and finally revising my work, words could not be enough to thank him.

Dr. Manal Hashem, the lecturer at the Clinical Pathology department, has accepted very willingly, and very patiently to aid in carrying-out the practical part of my work, and aided me much in interpreting the results obtained.

At last, but by far least, I would like to thank all my colleagues and friends who have withstood my enthusiasm in order to complete my work.

*Maryse Soliman Ayoub*

*the one before all and after all*

# TO MY FAMILY

*which has tolerated me much, with love and kindness*

INTRODUCTION

AND AYM OF WORK

## **INTRODUCTION** **AND AIM OF THE WORK**

### **INTRODUCTION;**

In diabetic patients, microalbuminuria predicts not only development of diabetic nephropathy, but also of retinopathy, neuropathy, hypertension, and macrovascular disease [Jensen, 1991].

Microalbuminuria is purposed to be a marker of wide-spread vascular damage, which may underlie the propensity of microalbuminuric patients to develop extrarenal vascular disease [Decket et al., 1989].

The endothelium is an important locus for control of vascular functions. It actively regulates vascular tone and permeability, the balance between coagulation and fibrinolysis, the composition of subendothelial matrix, and mitogenesis of vascular smooth muscles and mesangial cells [Van et al., 1990].

In patients with microalbuminuria, the vascular endothelium tends to increase vascular resistance, and fails to restrict passage of macromolecules, thus microalbuminuria reflects an increase in trans-capillary passage of these macromolecules [Collier et al., 1992].

Von-Willebrand factor is a glycoprotein involved in primary hemostasis, and is secreted mainly by endothelial cells. It was first described in a bleeding disorder, and later was viewed to have a role in the pathogenesis of atherosclerosis and in thrombus formation. Just as low levels predispose to disease,

high levels may lead to adverse cardiovascular events, such as myocardial infarction, and femoral artery occlusion, which may both be precipitated by thrombus formation [Blann, 1993].

### AIM OF THE WORK:

The aim of the current study is to assess levels of von-Willebrand factor in non-insulin dependent diabetic patients, with and without microalbuminuria (as a marker of microvascular disease), and cardiovascular complications (as a marker of macroangiopathy), which may allow recognition of high risk patients.

# REVIEW OF LITERATURE

## **SECTION I** **REVIEW OF LITERATURE**

### **CHAPTER I**

### **DIABETES MELLITUS**

#### **1.A. Definition of Diabetes Mellitus**

Diabetes Mellitus [DM] is a heterogenous primary disorder of carbohydrate metabolism, with multiple etiologic factors that generally involve absolute or relative insulin deficiency, or insulin resistance, or both. All causes of DM ultimately lead to hyperglycemia, which is the hallmark of this disease syndrome [Olfsky et al., 1993].

Diabetes constitutes a major public health issue, due to the sheer number of patients number of patients affected and to the risk of associated diseases specially affecting cardiovascular, renal, and nervous systems [Assal and Golay, 1994].

#### **1.B. Epidemiology of Diabetes Mellitus**

The definition and general acceptance of precise diagnostic criteria for diabetes mellitus by the WHO in 1995 permitted standardized estimates of the worldwide prevalence of the disease.

Non-insulin dependent diabetes mellitus (NIDDM), is the commonest form of diabetes with prevalence of 3-4% of the entire population, varying widely from country to country, reaching approximately 1% in Japan and China, versus 35% in Pima Indians of Arizona and Nauru of Micronesia [Papoz and Eschwege, 1990].

The prevalence of insulin dependent diabetes mellitus (IDDM) is more accurate because of the abrupt symptoms, while in fact many patients with NIDDM are asymptomatic, and remain undiagnosed [Zimmet, 1992].

### 1.C. Classification of DM

The widely accepted classification of DM recommended by the 1985 WHO study group, was based primarily on clinical descriptive criteria, and its retention is recommended for the present. The classification includes a number of clinical classes and designated statistical risk classes. This is demonstrated in the following table.
