Name: Heba Nashaat Ahmed Hamoudy

Date and place of birth: 16-11-1986, kaha

Nationality: Egyptian

Title of thesis:" THERAPEUTIC POTENTIALITY OF “EPIGALLOCATECHIN-3-GALLAT” and/ OR PACITAXEL IN TARGETING CANCER STEM CELLS (CSCs) IN MAMMARY GLAND TUMORS

Scientific degree: Master's Degree (M.V.Sc.)

Supervisors:

Prof. Mohamed Mostafa Lotfy

Professor of Pathology, Faculty of Veterinary Medicine, Cairo University

Prof. Dr. Sahar Samir Mahmoud

Professor of Pathology, Faculty of Veterinary Medicine, Cairo University

Prof. Dr. Gehan Gamil Ahmed

Chief Researcher, Pathology department, Animal Health Research Institute, Dokki, Giza

Abstract

Cancer stem cells (CSCs) are a subpopulation of tumor cells that own self-renewal capability, tumor recurrence and metastasis as well as resistance to current cancer therapies. Epigallocatechin-3-gallate (EGCG) is a type of catechin found in green tea that is known by its powerful chemoprotective ability. Hence, the current study aimed to focus on the effect of EGCG on 7,12 Dimethyl-benzanthracene (DMBA) -induced tumor metastasis, angiogenesis and CSCs. For these reasons both *in vitro* and *in vivo* studies were carried out. The *in vitro* evaluation of the effect of the used chemicals (paclitaxel, EGCG and their combination) at different doses on one of the breast cancer cell line, MCF-7 was carried out to evaluate the cell viability and apoptosis. The highest significant alterations in cellular morphology were observed on the sole use of EGCG followed by combined use of both paclitaxel and EGCG, while the use of paclitaxel alone showed the least effect. It was observed that the later cellular alterations were dose related. *In vivo* studies, therapy was started in 3 groups of DMBA-induced mammary cancer in virgin female rats using EGCG, paclitaxel or their combination. It was found that EGCG exhibited significant chemopreventive

effects and anti-CSCs activity through several pathways including significant decrease in the size and number of tumors/ rat, significant amelioration of the oxidative stress markers' alterations as well as significant inhibition of CD44, VEGF, Ki-67 and MMP-2 expression associated with significant increased expression of caspase-3. In addition, the combination of EGCG to paclitaxel significantly enhanced the later anticancer efficacy. Herein it is concluded that EGCG could be offered as an unprecedented curative strategy to eradicate cancer.

Keywords: Cancer stem cells (CSCs), EGCG, antioxidant, Ki-67, CD44, mammary tumor.

Acknowledgement

First of all, my deep prayerful gratitude should be submitted to merciful GOD whose help I always seek and without his willing I will achieve nothing.

*My deepest gratitude and faithful thank to **Prof. Dr. Prof. Mohamed Mostafa Lotfy** professor of pathology, faculty of veterinary medicine, Cairo University for his supervision, continuous aid and fruitful advice, great help and encouragement during course of this work,*

*My deepest gratitude and faithful thank to **Prof. Prof. Dr. saher Samir mahmoud**, professor of pathology, faculty of veterinary medicine, Cairo University for his supervision, continuous aid and fruitful advice, great help and encouragement during course of this work,*

*I would like to express my deep appreciation and gratitude to **Prof. Dr. Gehan Gamil Ahmed**, professor of pathology, Animal Health Research Institute, Dokki, Giza and Great gratitude for all staff members of pathology, Animal Health Research Institute, Dokki, Giza.*

*I would like to acknowledge the **Research Park, Faculty of Agriculture, Research lab, Cairo university** for its great role in culture and assessment of cancer cell line and culture; and its great help in management of the in vitro study.*
