Pounding of Buildings with Different Adjacent Floor Levels

A Thesis
Submitted to the Faculty of Engineering
Ain Shams University for the Fulfillment
of the Requirement of M. Sc. Degree
In Civil Engineering

Prepared by
Mahmoud Eid Nasr Mansour
B.Sc. in Civil Engineering, June 2010
Faculty of Engineering, Ain Shams University

Supervisors
Prof. Ibrahim Shawky Moharam
Professor of Structural Engineering
Ain Shams University

Dr. Hisham Ahmed El-Arabaty
Associate Professor of Structural Engineering
Ain Shams University

Dr. Mahmoud Hassan Ibrahim
Assistant Professor of Structural Engineering
Ain Shams University

DEDICATION

This work took years from my life. I wish to dedicate it to who suffered to educate, prepare and help me to be as I am,

TO MY MOTHER AND THE SOUL OF MY FATHER

I wish to dedicate my thesis

TO MY BROTHER Dr. NASR EID NASR

for his encouragement and help to complete this work.

Statement

This dissertation is submitted to Ain Shams University for the degree of Master of Science in Civil Engineering (Structural Eng.)

The work included in this thesis was carried out by the author in the Structural Engineering Department, Faculty of Engineering, Ain Shams University, Cairo, Egypt.

No part of this thesis has been submitted for a degree or qualification at any other university or institution.

Date: / /2015

Signature:

Name: Mahmoud Eid Nasr Mansour

Abstract

This thesis concerned with the problem of pounding between adjacent buildings with different floor levels, as it leads to damage of buildings, and sometimes total collapse specially in the case of not taking the collision phenomenon into account during the design, also when the two buildings with different floor levels. The study of this phenomenon is particularly important in Egypt, due to the presence of large areas in Cairo, and other cities, where buildings are erected totally adjacent to each other, without very small, or even no distance between them. This is especially evident in the old city districts, where city regulations allow building on 100% of the land area.

From previous research a finite element 3-D Model for analysis adjacent buildings under pounding (**Moustafa,A.2013**) was modified and extended to include the analysis of buildings with different floor levels. The structural behavior of buildings under the effect of pounding is simulated using 3-D finite element analysis of the buildings, while modeling the case of pounding at several points along each floor level, by introducing special gap elements between the 2 buildings at these points. Time-history analysis of several buildings was performed in 3-D modeling using three different time history, under the effect of actual earthquake records scaled according to the Egyptian code of practice specifications for Cairo area.

An extensive parametric study is conducted for the determination of the effect of the main factors affecting the pounding behavior of the adjacent buildings with different floor levels, including the effects of

separation distance, floor level and distribution of the structural elements in plan. Special emphasis is placed on the case of zero-gap distance between buildings, due to its wide-spread existence in case of actual buildings built in many Cairo districts. The analysis results were used to develop conclusions and recommendations related to the structural behavior of buildings with floors in the same level and floors in different levels subjected to pounding.

Key Words Pounding – adjacent Buildings – Different Floor Levels- Gap Distance – Earthquake – Time History

Acknowledgement

First of all, I thank GOD who guided and helped me to finish this work in the proper shape.

There are not any words to express how much my mother is suffered with me all my life not only in research.

I would like to express my deep appreciation to Prof. Ibrahim Shawky Moharam, Professor of Structural Engineering, Ain Shams University, I'm also extremely grateful to Dr. Hisham Ahmed El-Arbaty, Associate Professor of Structural Engineering, Faculty of engineering, Ain Shams University, for his direct supervision, generous and continuous support, guidance, encouragement, and valuable advices to perform this research. and Dr.Mahmoud Hassan Ibrahim, Lecturer of Structural Engineering, Faculty of Engineering, Ain Shams Univeristy for their experienced advice, continuous support and deep encouragement through all phases of the work.

I don't know how to express my deepest thanks to my family for their support, encouragement and taking care of me during the research especially my brother Dr.Nasr Eid Nasr, Lecturer of Structural Engineering, Faculty of Engineering, Ain Shams Univeristy for his big effort with me since I was child .

Finally, I would like to thank my friends who encouraged me in the completion of this work and I have to say thank you for my friend Eng.Akram Moustafa, teaching assistant of Structural Engineering, Faculty of Engineering, Ain Shams Univeristy for his direct help with me.

Table of contents.....	vii
List of figures	xii
List of tables	xliii
List of symbols	1
Chapter 1 Introduction	1
1.1 Pounding phenomenon	1
1.2 Basic cases of pounding:	1
1.3 Pounding types	5
1.3.1 Floor to floor pounding	5
1.3.2 Column to floor pounding.	5
1.3.3 Heavy building to lighter building pounding.	6
1.3.4 Pounding between tall buildings adjacent to short one.	7
1.4 Objective of the work	7

1.5 Outline of the thesis	8
Chapter 2 Literature Review	11
2.1 Introduction.....	11
2.2 Modeling the Pounding Action	11
2.2.1 Single Degree of Freedom (SDOF) Models	12
2.2.2 Multi Degree of Freedom (MDOF) Models	18
2.2.3 Two Dimensional Frame Idealization Models.....	24
2.2.4 Three-Dimensional Models	35
Chapter 3 Methodology	45
3.1 Introduction.....	45
3.2 Selection and verification of the SAP program	46
3.2.1 Time history analysis	46
3.2.1.1 Non-linear time history analysis	47
3.2.1.1.1 Loading	48
3.2.1.1.2 Initial conditions	49
3.2.1.1.3 Non-linear solution control	50
3.2.2 Contact element between the adjacent buildings	52

3.2.3 Verification of the time history analysis using (SAP).....	53
3.2.4 Verification of the gap element	57
3.3 Time history used for analysis.....	65
Chapter 4 Building Description	69
4.1 Introduction	69
4.2 Buildings description.....	69
4.2.1 First case (equal number of floor and equal floor levels).....	70
4.2.2 Second case (equal number of floor and different floor levels).	74
4.2.3 Third case (different number of floor and equal floor levels).	78
4.2.4 Fourth case (different number of floor and different floor levels).	82
4.3 Results of finite element model analysis.	86
4.3.1 Snapshots for deformation results.	87
4.3.2 Snapshots for straining actions results.	90
Chapter 5 Parametric Study.....	95
5.1 Introduction.	95
5.2 First Case.	97

5.2.1 Effect of gap distance variation on buildings deformation. .	105
5.2.2 Effect of gap distance variation on structure straining actions.	107
5.3 Second Case.	114
5.3.1 Effect of gap distance variation on buildings deformation. .	122
5.3.2 Effect of gap distance variation on structure straining actions.	124
5.4 Comparison between first and second cases (effect of floor levels of adjacent buildings).	131
5.4.1 Deformations.....	131
5.4.2 Straining actions.....	137
5.5 Third Case.	157
5.5.1 Effect of gap distance variation on buildings deformation. .	171
5.5.2 Effect of gap distance variation on structure straining actions.	174
5.6 Fourth Case.	186
5.6.1 Effect of gap distance variation on buildings deformation. .	200
5.6.1 Effect of gap distance variation on structure straining actions.	203

5.7 Comparison between first and second cases (effect of floor levels of adjacent buildings).....	215
5.7.1 Deformations.	215
5.7.1 Straining actions.	224
5.8 Discussion of Results.....	258
Chapter 6 Summary and Conclusion	265
6.1 Summary.....	265
6.2 Conclusions	266
6.3 Recommendations for future work	267
References.....	269
