Title of Thesis:

Short circuit current calculation for full converter based wind power plants

Key Words:

Full converter based wind turbines; Short circuit current calculation; Fault ride through; Generic model

Summary:

This thesis presents a new method for calculating steady state short circuit current of full converter based wind generator using generic model, taken into consideration Low Voltage Ride Through requirements and voltage support according to the grid codes. To evaluate the performance of the method, two case studies have been performed. The method has been implemented in Matlab, and the results are compared with that deduced from dynamic simulation using Power World Simulator program that contains the generic model of the full converter based wind power plants the difference in the results is within 1%, which confirms the accuracy of the proposed method.

Acknowledgment

Praise be to Allah, Lord of the Worlds, who taught me what I did not know. It is my honor to thank my supervisor Prof.Dr. Zeinab H. Osman for her excellent thesis supervision, continuous support, advice to me and her generous treatment as her son. As I thank my supervisor Dr.Amgad El-Deib for his valuable information which helped me in ending this thesis, on a personal level, he fully supported me and continued to encourage me and he was credited after God for accomplishing this thesis, and his valuable advices that help me not only in my thesis, but also in my life. I also thank Dr.Nabil Ayad, Dr Salah EL Morshidy, and Dr. Ayman Azab for their continuous support in my work. I also thank my brothers and friends for their constant encouragement to get a Master degree. I would like to thank my colleagues Eng. Montaser Belah Medhat, Eng.Mohamed Karim, and Dr. Muhammad Mansy for their continuous support. In the end, I would like to thank my beloved mother, who has always supported me and stood beside me in hard times.

Dedication

I dedicate this thesis to my dad, brothers, and friends .
