

PROCESSING OF NON-TRADITIONAL FISHERY PRODUCTS

By

MUSTAFA MUSTAFA MAHMOUD

B.Sc. Agric. Sc. (Food Science), Moshtohor, Zagazig University. (2005)

A Thesis Submitted in Partial Fulfillment

of

The requirements for the degree of

MASTER IN AGRICULTURE SCIENCE

(Food Science and Technology)

Department of Food Science

Faculty of Agriculture

Ain Shams University

2016

Approval Sheet

**PROCESSING OF NON-TRADITIONAL FISHERY
PRODUCTS**

By

MUSTAFA MUSTAFA MAHMOUD

B.Sc. Agric. Sc. (Food Science.), Moshtohor, Zagazig University. 2005

This thesis for M.Sc. degree has been approved by:

Dr. Ashraf M. Sharoba

Prof. of Food Technology, Faculty of Moshtoher Agriculture, Banha
University.

Dr. Manar T. Ibrahim

Prof. of Food Science and Technology, Faculty of Agriculture, Ain
Shams University.

Dr. Nessrien M. N. Yasin

Prof. of Food Science and Technology, Faculty of Agriculture, Ain
Shams University.

Dr. Mohamed F. Khallaf

Prof. of Food Science and Technology, Faculty of Agriculture, Ain
Shams University.

Date of Examination: / / 2016

PROCESSING OF NON-TRADITIONAL FISHERY PRODUCTS

By

MUSTAFA MUSTAFA MAHMOUD

B.Sc. Agric. Sci. (Food Science.), Moshtohor, Zagazig University. 2005

Under the supervision of

Dr. Mohamed Farag Khallaf

Prof. of Food Science and Technology, Faculty of Agriculture, Ain
Shams University, (Principal Supervisor).

Dr. Nessrien Mohamed Nabih Yasin

Prof. of Food Science and Technology, Faculty of Agriculture, Ain
Shams University.

Dr. Mohamed Abo Taleb El-Sayed Hassanin

Prof. of Fish Processing and Technology, Fish Processing and
Technology Lab., National Institute of Oceanography and Fisheries,
Cairo.

ABSTRACT

Mustafa Mustafa Mahmoud. “Processing of Non-Traditional Fishery Products”. Unpublished M.Sc. Thesis, Department of Food Science, Faculty of Agriculture, Ain Shams University, 2016.

This study was carried out to process fish pastirma from catfish (CFP) as well as common carp fillets (CCFP) and fish chips using silver carp fish meat. Fish pastirma samples were subjected to physicochemical, microbiological and organoleptic analysis on 0, 3th, 6th, 9th, 12th and 15th days of storage at 25±2°C and on 0, 7th, 14th, 21th and 30th days of storage at refrigeration (5±1°C). The chemical composition of fish pastirma (moisture, protein, fat, ash, carbohydrate and salt contents) were variable significantly ($p<0.05$) during storage, the moisture and carbohydrate contents decreased significantly in opposite trend with the protein, fat and ash contents during storage at 25±2°C. While, these attributes were inconsistent during storage at 5±1°C. Finally, the changes in chemical composition of fish pastirma during cold storage were less than that occurred during storage at 25±2°C. The TVB-N, TMA-N and tyrosine values increased significantly ($p<0.05$) for all fish pastirma samples until end of storage. While, TBA value of fish pastirma showed unsteadily trends during storage periods. TVB-N, TMA-N and TBA values of fish pastirma were not exceed on the acceptable limits, but TVB-N values of refrigerated fish pastirma were higher than permissible limit of acceptability at the end of storage. The storage periods caused significant increasing and decreasing ($p<0.05$) in pH value of (CFP) and (CCFP), respectively at the end of storage, at which the WHC of refrigerated fish pastirma were higher than that stored at 25±2°C. During storage the TBC and aerobic spore forming bacteria numbers of fish pastirma were increased significantly ($p<0.05$), but, the coliform and molds & yeasts counts were $<10 \times 10^1$ cfu/g during days analysis of differently storage. The sensory evaluation attributes showed clearly decreasing scores during storage at 25±2°C, whereas the refrigerated samples could be retained its eating quality until end

of storage. However, all fish pastirma samples were accepted after 15 days at ambient temperature and 30 days of cold storage.

Fish chips produced from silver carp meat showed the best formulas. Fish chips subjected to organoleptic analysis as "fried ", physicochemical and microbiological analysis on 0, 1st, 2nd and 3rd months of storage at -18±2°C. The drying process had significant effect ($p<0.05$) on the chemical composition of fish chips.

After drying, the TVB-N, TMA-N and tyrosine values showed significant increasing ($p<0.05$). The physical properties of fish chips in term of WHC, cooking loss and pH values were decreased significantly after drying. The pH values increased at the end of frozen storage. At which, WHC% and cooking loss% showed significant decline ($p<0.05$) after the first month of storage. In addition, the significant differences were found between the formulas in physical properties. The numbers of (TBC) decreased significantly ($p<0.05$) after drying. On contrary, the numbers of aerobic spore forming bacteria of fish chips were increased. The microbial loads appeared significant decline after the 1st month of frozen storage. The coliform group, molds & yeasts as well as salmonella & shigella were absent in all samples. The raw and dried fish chips formulas were accepted in terms of sensory analysis; moreover, the best formula was **(D)** that consisted of (35% fish, 35% potato and 25% starch).

Therefore, fish pastirma and fish chips as new products considered as one of the successful methods to improve catfish, common carp and silver carp fish utilization, which is undesirable in its fresh form because its sensorial properties and a one of the trials for high production of fish farms from these species in Egypt.

Keywords: Fish pastirma - Fish chips - *Clarias lazera* - *Cyprinus carpio* - *Hypophthalmichthys molitrix* - Organoleptic evaluation - Physicochemical properties - Microbiological quality – Chemical quality.

ACKNOWLEDGMENT

First of all, cordial thanks to **ALLAH** who enabled me to overcome all the problems, which faced me through this work.

I would like to express my sincere gratitude to **Prof. Dr Mohamed Farag Khallaf**, Head. of Food Sci. Dept., Faculty of Agric., Ain-Shams University, for his kind supervision, advices, continuous valuable, fruitful criticism and encouragement throughout this work.

I am grateful and indebted to **Prof. Dr. Nessrien Mohamed Nabih Yasin**, Prof. of Food Sci. and Tech., Food Sci. Dept., Faculty of Agric., Ain-Shams University, for her kind supervision, suggestions and support of this work, motivation and continuous supply with continuous advices during this work.

I would like to express my sincere gratitude to **Prof. Dr. Mohamed Abo Taleb El-Sayed Hassinin**, Prof. of Fish Processing and Technology, Fish Processing and Technology Lab., National Institute of Oceanography and Fisheries, Cairo, for his kind supervision, suggestion, valuable encouragement.

Great thanks for **all staff members, colleagues and secretary** of Food Science Department, Faculty of Agric., Ain-Shams University for their helps and behavior with post graduate students. Also, I would like to express my great thanks and indebtedness to **all staff members** of National Institute of Oceanography and Fisheries, Cairo, El-Kanater El-Khiria branch.

I would like to express my deep thanks to **my parents and family** for their patience, understanding and moral support to give me the chances to complete this work.

INTRODUCTION

Fish is considered as a highly protein rich food in relation to vegetable and other animal foods. It is a fact that millions of people in developing countries are suffering from malnutrition mainly because of protein deficient food. Fish can play an important role as a source of protein of high digestibility, minerals especially calcium and iron as well as vitamins (**Coway *et al.*, 1981**). Fish flesh is tasty and highly digestible, it minimizes the risk of heart diseases and increases life expectancy (**Barlas, 1986**). Fish is a major source of proteins of high digestibility and are rich source of lysine and containing amino acids. In Africa, over 17.5% of the animal protein comes from fish (**Olatunde, 1989**). Fish is a good source of protein and can be used as an alternative to meat (lamb and chicken). The reasons are fish had low cholesterol, optimal protein amount, high digestibility and polyunsaturated fatty acids such as omega-3 and essential amino acids (**Boran and Köse, 2007**).

Consequently, Fish processing has a special concerning in fishing and aquaculture industries. The processing and preservation of fresh fish were of almost importance since fish is highly susceptible to deterioration immediately after harvest and also to prevent economic losses (**Okonta and Ekelemu, 2005**). In addition, fish processing has a special place in fishing and aquaculture industries. In recent years, the increasing number of working women has directed the consumer preferences to ready-to-eat fish products like fish burger, fish cakes, fish crackers, fish fingers, marinated products, *etc.* (**Kilinc, 2007**). Modern life-style demands a consistent food supply with high quality that is convenient as well as affordable (**FAO, 2007**). There are several animal and plant food savers available worldwide. Among them, the most important animal protein saver that caters to the human needs comes from aquaculture. The world population is continuing each and every year that will exceed 10 billion by the year 2050 (**Subasinghe, 2005**). The global demands compel a consistent food supply that too in good quality. These demands are fulfilled by the intensive aquaculture practices in particular to
