Acknowledgement

I wish to thank all the people who have directly or indirectly influenced this work in a positive way, some of whom I might not remember. I have to thank my kind supervisors who led me through the dark passages of my inexperienced journey.

*Special thanks to **Professor Dr. Soad Soltan**, my senior supervisor who helped through careful choice of the subject and caring supervision of all the details. I wish to express to her my great thanks for her invaluable help and support. **Dr. Ula Al-Jarhi** was no less enthusiastic in close supervision and guidance all through the work. I greatly appreciate her professional support and advice. I wish to thank her for offering so much time and effort to complete this work. Many thanks to **Dr. Mona Fathy** for taking to her responsibility the tedious job of conducting the labwork and helping in interpretation of the results.*

I thank all the patients who have willingly and kindly cooperated to be part of our study. I wish them the best of health.

Last but not least, I find no words worthy enough to express my deepest gratitude towards my family. Without their constant encouragement and precious support this work would have never seen light.

Marwa Elshafai

Abstract

Background: The pathogenesis of diabetic nephropathy is complex and still not fully elucidated. Epidemiological studies report a relationship between serum uric acid concentrations and chronic kidney disease.

Aim: To study the relation between hyperuricemia and diabetic nephropathy in type 2 diabetes mellitus. The relation of hyperuricemia with other microvascular complications and components of metabolic syndrome was studied as well.

Methods: The study included 50 patients with type 2 diabetes, 33 patients with metabolic syndrome and 17 patients without metabolic syndrome. Serum uric acid, Serum creatinine, Creatinine clearance, A/C ratio, urine analysis, FBG and Lipid profile. Fundus examination abdominal ultrasound were done to all patients.

Results: Serum uric acid showed significant positive correlation with the degree of albuminuria, and creatinine level and diabetic retinopathy. Also there is a strong association between uric acid and the metabolic syndrome and its components.

Conclusion: Elevated uric acid may be a risk factor for development of metabolic syndrome. Uric acid may play a role in development and progression of diabetic nephropathy and retinopathy.

Keywords:

1- Serum uric acid-

2- Type 2 diabetes mellitus

3-metabolic syndrome

4- diabetic Nephropathy

List Of Abbreviations

NASH	nonalcoholic steatohepatitis
ESRD	End-stage renal disease
GFR	glomerular filtration rate
IDDM	Insulin dependent diabetes mellitus
UKPDS	United Kingdom prospective diabetes study
CVD	cardiovascular diseases
AGEs	Advanced glycosylation end products
mRNA	Messenger ribonucleic acid
IGF-1	Insulin-like growth factor-1
DCCT	Diabetes control and complications trial
DNA	Deoxyribonucleic acid
RRT	renal replacement therapy
UAE	urinary albumin excretion
ACE-I	angiotensin-converting enzyme inhibitor
MDRD	Modified Diet in Renal Disease
HOT	Hypertension Optimal Treatment study
ARBs	angiotensin II receptor blockers
HOPE	Heart Outcomes Prevention Evaluation Study
DCCT	Diabetes control and complications trial
DNA	Deoxyribonucleic acid
RAS	Renin Angiotensin System
COOPERATE	Combination Treatment of Angiotensin-II Receptor Blocker and Angiotensin-Converting-Enzyme Inhibitor in Nondiabetic Renal Disease
DOQI	Dialysis Outcome Qualitative Initiative

BP	blood pressure
LDL	Low density lipoprotein
HDL	High density lipoprotein
Hb A1c	Haemoglobin A1c
DM	Diabetes mellitus
BED	binge eating disorder
NHLBI	National Heart, Lung, and Blood Institute
AHA	American Heart Association
ECG	Electrocardiography
SPECT	Stress single-photon emission computed tomography
BMI	body mass index
PAI-1	plasminogen activator inhibitor-1
TSH	thyroid stimulating hormone
ACC	American College of Cardiology
ASCVD	atherosclerotic cardiovascular disease
CPAP	continuous positive airway pressure
CETP	Cholesteryl ester transfer protein inhibitors
HMG-CoA	Hydroxyl-methyl-gluteryl co-enzyme A
AHA-ASA	American Heart Association-American Stroke Association
DASH	Dietary Approaches to Stop Hypertension
PPAR-gamma	peroxisome proliferator-activated receptor-gamma
URAT1	A urate/anion exchanger
hOAT1	human organic anion transporter 1
UAT	urate transporter
HGPRT	hypoxanthine guanine phosphoribosyltransferase
PRPP	phospho-alpha-d-ribosyl pyrophosphate
IL-1	interleukin 1

ATP	Adenosine triphosphate
NALP3	NACHT, LRR and PYD domains-containing protein 3
HFI	Hereditary fructose intolerance
NSAIDs	nonsteroidal anti-inflammatory drugs
FDA	US Food and Drug Administration
PMN	Polymorphonuclear leukocytosis
CT	computed tomography
GIP	glucose-dependent insulintropic polypeptide
GLP-1	glucagonlike peptide-1
SNPs	single-nucleotide polymorphisms
GIPR	gastric inhibitory polypeptide
HMGA1	The high mobility group A1 protein
IFG	impaired fasting glucose
NPH	neutral protamine Hagedorn
IGT	impaired glucose tolerance
TCF7L2	transcription factor 7–like 2 gene.
MODY	maturity onset diabetes of youth
CDC	Centers for Disease Control and Prevention
DKA	Diabetic ketoacidosis
HNS	Hyperosmolar nonketotic state
ED	emergency department
LADA	latent autoimmune diabetes of the adult
post-OGTT	post-oral glucose tolerance test
ADA	American Diabetes Association
NGSP	National Glycohemoglobin Standardization Program
