#### **SUMMARY AND CONCLUSION**

Acute myeloid leukemia describes a heterogenous group of hematological disorders characterized by a block in the terminal differentiation of a particular hematopoietic cell lineage. Cytogenetic and molecular assays have allowed patients' follow up aiming for detection of minimal residual disease, prediction of patients' outcome, in addition to providing the rationale for designing novel molecular-targeted therapeutic strategies.

Human telomerase RNA componant (hTERC), encoded by the hTERC gene is frequently amplified in human tumors, which indicates that the hTERC gene may be a target for amplification during the transformation of human malignancies including hematological malignancies. This genetic event has implications in diagnosis, prognosis and therapeutics of cancer.

In this regard, this study aimed to detect hTERC gene amplification in AML patients by FISH analysis and its relation to the standard prognostic factors.

In the current work, BM or PB samples were obtained from 21 adult AML patients, presented at the Hematology/Onclology Unit, Ain Shams University Hospitals. The patients were further divided into two groups; group I (12 patients) containing newly diagnosed AML patients and a relapsed case and group II (8 patients) containing patients taken at 28<sup>th</sup> day of chemotherapy.

All patients were subjected to complete history, thorough clinical examination and laboratory investigations including: complete hemogram, bone marrow aspiration with examination of Leishman-stained peripheral blood and bone marrow smears, immunophenotyping, karyotyping and detection of hTERC gene amplification using FISH technique.

## Acknowledgement

First of all, great thanks to **ALLAH** who is most merciful, for all the countless gifts I have been offered.

I would like to express my endless gratitude and appreciation to **Professor**. **Iman Mohamed Amin Omar** Professor of Clinical and Chemical Pathology, Ain Shams University, for her continuous guidance, valuable suggestions and keen supervision throughout the work.

I would like to express my sincere gratitude and deepest appreciation to **Professor. Nivine Abd El Rahman Helmy**, Professor of Human Genetics, National Research Center, for her instructive supervision & encouragement, remarkable guidance, great concern, scientific and personal support throughout the course of this work.

My endless thanks to **Professor. Daliah El Sweify**, Professor of Clinical and Chemical Pathology, Ain Shams University, for her valuable instructions, generous help, unlimited support and effort to get best out of this work.

Indeed, words do fail me when I come to express my profound gratitude and deep appreciation to **Doctor. Maha Mohamed Eid** for her everlasting support, honest encouragement and for offering me much of her time and effort.

Many thanks to **Doctor. Danzhou Yang,** Associate Professor of Medicinal Chemistry, University of Arizona for helping me understanding the telomere model and for his kind supplementation of books.

Last, but not least, I would like to thank **my family** for their actual help and support received in many ways.

Islam Fadel

A	Alpha
В	Beta
$\chi^2$	Chi-square
-	Monosomy
+	Trisomy
°C	Degrees centigrade
μ	Micro
ALL	Acute lymphoblastic leukemia
ALT	Alternative Lengthening of Telomeres
AML	Acute myeloid leukemia
AMML	Acute myelomonocytic leukemia
AP	Acid Phosphatase
AP1	Activator protein 1
APL	Acute promyelocytic leukemia
ATRA	All-trans retinoic acid
BAALC	Brain and acute leukemia, cytoplasmic
BM	Bone Marrow
bp	Base Pair
c	Cytoplasmic
СВГВ	Core binding factor β
CCA	Conventional Cytogenetic Analysis
CD	Cluster of differentiation
cDNA	Complementary DNA
CEBPA	CCAAT/enhancer-binding protein alpha
CGH	Comparative Genomic Hybridization
CIR	crude incidence rate of cancer
c-KIT	Proto-oncogene tyrosine-protein kinase
CML	Chronic myeloid leukemia
c-myc	Cellular myelocytomatosis
CN	Cytogenetically normal
CNS	Central nervous system
CpG	Cytosine followed by Guanine on the same strand
CR	Clinical remission
CRD	Complete remission duration
C-terminal	Carboxyl terminal
DAPI II	4',6-diamidino-2-phenylindole

Del	Deletion
D-FISH	Double fusion Fluorescence In Situ Hybridization
DFS	Disease free survival
DIC	Disseminated intravascular coagulopathy
DKC	dyskeratosis congenita
DKC1	dyskeratosis congenita gene 1
DNA	Deoxyribonucleic acid
DSB	Double strand breaks
DW	Distilled water
EM	Electron microscopy
EFS	Event free survival
ETS	E-twenty six family of transcription factors
ERG	ETS-related gene
FAB	French-American-British
FdU	Fluorodeoxyuridine
FISH	Fluorescence In Situ Hybridization
FLT3	FMS-like tyrosine kinase 3
FLT3-TKD	Tyrosine kinase domain of FLT3
G	Guanine
gm	Gram
G1	G1 Phase in cell cycle the Pre-synthetic phase
G-banding	Giemsa banding
GEP	Gene expression profiling
G-quadruplex	Guanine-quadruplex
G-rich	Guanine -rich
Н	Histone
H/ACA	RNA-protein complex component
H2AX	a phosphorylated variant of histone 2A
H3	Histone 3
H4	Histone 4
HB	Hemoglobin
HCL	Hydrochloric acid
HEST1A	Human ever shorter telomeres-1
HiDAC	High-dose cytarabine
HIF-1	hypoxia-inducible factor 1
HLA	Human leucocyte antigene
hMSC	Human mesenchymal stem cells

Table No.	Figure Title	Page No.
14	Typical myeloblasts with eccentric nuclei and maturing dysplastic granulocytes at all stages of development.	50
15	Sudan black B positivity in blasts, stronger in dysplastic metamyelocytes. Inset: Chloroacetate in maturing granulocytes	50
16	Hypergranular promyelocytes (right). Variable granule content and multiple Auer rods visible (left).	50
17	Sudan black B stain. Typical heavy cytoplasmic positivity.	50
18	Promyelocyte chloroacetate esterase positivity (blue). Inset: atypical ANAE positivity seen in 1% of M3 cases.	51
19	Typical bilobed nuclei and basophilic cytoplasm packed with granules too small to resolve by light microscopy, but which give typical M3v cytochemical reactions.	51
20	Mixed population of myeloblasts and monoblasts. Inset: chloroacetate esterase positive granules (blue), ANAE-positive monocytes (green/brown).	51
21	Left: large monoblasts with central nuclei and abundant cytoplasm. Right: monoblast ANAE positivity (brown), and one blue chloroacetate esterase positive myelocyte	51
22	Marked dyserythropoiesis (>50% of cells), with dysplastic granulocytes.	52
23	Left: giant multinucleate late normoblasts. Right: PAS stain; granular in proerythroblasts, homogeneous in normoblasts	52
24	Megakaryoblasts / micro- megakaryocytes in bone marrow aspirate.	52
