

# **Assessment of Developmental Apraxia of Speech in children with Specific Language Impairment**

**Thesis**

Submitted for fulfilment of Master degree in Phoniatics

**By**

**Ayatallah Raouf Sheikhany**

M.B., B.Ch.

**Under Supervision of**

**Prof. Dr. Essam Aly Abd El Nabi**

Professor of E.N.T

Head of E.N.T. Department

Faculty of Medicine - Cairo University

**Prof. Dr. Hossam Mohamed El Dessouky**

Professor of Phoniatics

Faculty of Medicine - Cairo University

**Dr. Dalia Mostafa Ahmed**

Assistant Professor of Phoniatics

Faculty of Medicine - Cairo University

**Faculty of Medicine**

**Cairo University**

**2009**

# LIST OF ABBREVIATIONS

AAC	Augmentative Alternative Communication
ADD	Attention Deficit Disorders
ADHD	Attention Deficit Hyperactive Disorder
AMR	Alternating Motion Rate
AOS	Acquired Apraxia of Speech
ASHA	American Speech Language and Hearing Association
CV	Consonant-Vowel
DAMP	Disorder of Attention of Motor Perception
DAS	Developmental Apraxia of Speech
DCD	Developmental Coordination Disorders
DDK	Diadochokinesis
DPD	Developmental Phonological Disorders
DSD	Developmental Speech Delay
DSM-IV	Diagnostic and Statistical Manual of Mental Disorders 4 <sup>th</sup> Ed.
ENT	Ear, Nose, and Throat
ICD-10	International Classification of Diseases-10
IQ	Intelligence Quotient
KE	KE
LR	Language Recall
MBD	Minimal Brain Damage
MLU	Mean Length of Utterance
MRI	Magnetic Resonance Imaging
MRR	Maximum Repetition Rate
NIDCD	National Institute of Deafness and Communication Disorders
OCD	Obsessive Compulsive Disorders
PET	Positron Emission Tomography
PWM	Phonological Working Memory
SD	Speech Disorders
SLI	Specific Language Impairment
SSD	Speech Sound Disorders
SSS	Social Scale Score
STM	Short Term Memory
TLD	Typical Language Development

# LIST OF TABLES

Table Number	Table Title	Page Number
1.	Comparison between subjects and controls revealed no significant difference in age (age match).	76
2.	Comparison between subjects and controls revealed no significant difference in gender (gender match)	76
3.	Comparison between subjects and controls revealed a significant difference in the ability to produce diadochokinetic movements.	77
4.	Comparison between subjects and controls in scores of S.S.S showed a significant difference in total score as well as all the subtests.	78
5.	Comparison between subjects and controls in Parents Observation showed a significant difference regarding all subtests: intelligibility, articulation, social skills, and academic performance.	78
6.	Comparison between subjects and controls regarding the production of: Different vowels in syllables /a/, /i/, and /u/ showed a significant difference, with greatest difference in /i/ scores. Phonemes in different positions (initial, middle, and final positions): showed a significant difference. Initial has higher scores than final than middle positions. Middle position seems to be the most difficult position. bisyllabic and polysyllabic words showed a significant difference. bisyllabic and polysyllabic showed lower scores for polysyllabic (mean:6.73) in comparison to bisyllabic (mean:15.37).	79
7. (a,b)	Comparison between subjects and controls in the production of different phonemes showed a significant difference in the production of all phonemes except (θ). In production of different phonemes, the most difficult was the voiced /z/, and the least difficult was the /n/.	80
8. (a,b)	Comparison between subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed a significant difference for all phonemes except the /θ/. Comparison between subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed that the most difficult was the voiced fricative /z/.	81
9.	Comparison between subjects and controls in oromotor movements showed no significant difference	82
10.	Comparison between subjects and controls in oral praxis showed no significant difference for most items apart from complex and multi-sequential actions such as (whistle, tongue click, and throat clearance) which showed a significant difference.	82

<b>11.</b>	<p>Comparison between subjects and controls regarding inconsistency showed a significant difference at both the word level as well as the sentence level.</p> <p>The inconsistency at the word level as well as the sentence level was equal.</p> <p>Comparison between subjects and controls regarding intelligibility showed a significant difference at both the word level as well as the sentence level.</p>	83
<b>12.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the parents' observation showed a significant difference in articulation and intelligibility, but no significant difference in social and academic performance.	84
<b>13.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the S.S.S. and its different items showed a significant difference.	85
<b>14.</b>	<p>Comparison between (more than) 5 years group in subjects and controls regarding the production of different syllables /a/, /i/, and /u/ showed a significant difference, with greatest difference in /i/ scores.</p> <p>Comparison between (more than) 5 years group in subjects and controls regarding the production of different phonemes in different positions showed a significant difference for all positions.</p> <p>Comparison between (more than) 5 years group in subjects and controls in initial, middle, and final. Initial has higher scores than final than middle positions. Middle position seems to be the most difficult position.</p> <p>Comparison between (more than) 5 years group in subjects and controls regarding production of bisyllabic and polysyllabic showed a significant difference.</p> <p>Comparison between the production of bisyllabic and polysyllabic showed lower scores for polysyllabic (mean: 10.2) in comparison to bisyllabic (mean: 19.2).</p>	86
<b>15.</b> (a,b)	Comparison between (more than) 5 years group in subjects and controls in the production of different phonemes showed a significant difference in the production of all phonemes except /θ/ and /n/. In production of different phonemes, the most difficult was the voiced /z/.	87
<b>16.</b> (a,b)	Comparison between (more than) 5 years group in subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed a significant difference for the following phonemes: /z/, /l/, /r/, /d/, /q/, /h /, /h/, /x/, /y/, with no significant difference in the rest of the phonemes.	88
<b>17.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the oromotor power showed no significant difference.	89
<b>18.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the oral praxis showed no significant difference except in whistling.	89
<b>19.</b>	Comparison between (more than) 5 years group in subjects and	90

	controls regarding the intelligibility on the word level showed no significant difference, however on the sentence level there was a significant difference. Comparison between (more than) 5 years group in subjects and controls regarding the inconsistency both on the word level as well as the sentence level showed no significant difference.	
20.	Comparison between (less than) 5 years group in subjects and controls regarding the S.S.S. and its different items showed a significant difference.	91
21.	Comparison between (less than) 5 years group in subjects and controls regarding the parents' observation showed a significant difference in all parameters.	91
22.	Comparison between (less than) 5 years group in subjects and controls regarding the production of different syllables /a/, /i/, and /u/ showed a significant difference, with greatest difference in /i/ scores. Comparison between (less than) and (more than) 5 years groups in subjects and controls regarding the production of different syllables /a/, /i/, and /u/ showed lower mean scores for all syllables in the under 5 group. Comparison between the less than 5 years group in subjects and control for different phonemic positions showed a significant difference for all positions; the middle position was the most difficult position.	92
23. (a,b)	Comparison between (less than) 5 years group in subjects and controls in the production of different phonemes showed a significant difference in the production of all phonemes except /θ/, /ð/ and /ð <sup>s</sup> ~/	93
24. (a,b)	Comparison between (less than) 5 years group in subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed a significant difference for all the phonemes except for /θ/, /ð/, /ð/ / <sup>s</sup> /.	94
25.	Comparison between less than 5 years group in subjects and controls regarding the oromotor power showed no difference in all subtests.	95
26.	Comparisons between (less than) 5 years group in subjects and controls regarding the oral praxis no significant difference except for the tongue click, and throat clearance.	95
27.	Comparisons between (less than) 5 years group in subjects and controls regarding the inconsistency showed a significant difference at both the word and sentence level. Comparisons between (less than) 5 years group in subjects and controls regarding the intelligibility showed a significant difference at both the word and sentence level.	96
28.	Comparison between males and females in S.S.S. showed no significant difference although the scores were lower for females than for males.	97
29.	Comparison between males and females in parents' observation showed no significant difference although the scores were lower for females than for males.	97

<b>30.</b>	Comparison between males and females in syllable production showed no significant difference although the scores were higher for females than for males. Comparison between males and females in different phonemic position showed no significant difference although the scores were higher for females than for males. Comparison between males and females in bisyllabic and polysyllabic showed no significant difference although the scores were higher for females than for males in bisyllabic word production.	98
<b>31.</b> (a,b)	Comparison between males and females in the production of different phonemes showed no significant difference although the scores were higher for females than for males.	99
<b>32.</b> (a,b)	Comparison between males and females in the production of different phonemes in sentences with variable length and complexity showed no significant difference although the scores were higher for females than for males.	100
<b>33.</b>	Comparison between males and females in the oromotor power showed no significant difference.	101
<b>34.</b>	Comparison between males and females in the oral praxis showed no significant difference in most items except tongue click and throat clearance, although the scores were higher for females than for males.	101
<b>35.</b>	Comparison between males and females in the inconsistency showed no significant difference although the inconsistency was more for males than for females. Comparison between males and females in the intelligibility showed no significant difference although the females are more intelligible at the word level.	102
<b>36.</b>	Correlation between age and S.S.S.	103
<b>37.</b>	Correlation between age and Parents' observation	103
<b>38.</b>	Correlation between age and syllable production in subjects showed positive significance. Correlation between age and different phonemic positions in subjects showed positive significance. Correlation between age and production of bisyllabic and polysyllabic words in subjects showed positive significance.	103
<b>39.</b>	Correlation between age and production of different phonemes in subjects showed positive correlation in /b/, /m/, /n/, /k/, /g/, /q/, /d/, /h/, /h/, /ʃ/, /θ/.	104
<b>40.</b>	Correlation between age and production of different phonemes in sentences in subjects showed positive correlation in /w/, /m/, /f/, /z/, /ʃ/, /t/, /d/, /k/, /g/, /q/, /d/, /h/, /h/, /ʃ/, /θ/, /t/, /y/, /x/, /ð/, /ð/.	105, 106
<b>41.</b>	Correlation between age and inconsistency in subjects showed high negative correlation at both the word and sentence level. Correlation between age and intelligibility in subjects showed positive correlation at the sentence level.	106
<b>42.</b>	Correlation between intelligibility and inconsistency in subjects showed negative correlation at both the word and sentence.	106
<b>43.</b>	Correlation between S.S.S and Parents' observation in subjects	106

	showed positive significant correlation in articulatory accuracy and social skills.	
<b>44.</b>	Correlation between S.S.S. and inconsistency and intelligibility in subjects showed no significant correlation both at the word level as well as sentence level.	107
<b>45.</b>	Correlation between age and oromotor movements in subjects showed no significant correlation for all movements.	107
<b>46.</b>	Correlation between age and oral praxis in subjects showed no significant correlation for all movements.	108

# LIST OF FIGURES

<b>Figure Number</b>	<b>Figure Title</b>	<b>Page Number</b>
<b>1.</b>	Comparison between subjects and controls: Age match.	109
<b>2.</b>	Comparison between subjects and controls in scores of S.S.S showed a significant difference in total score as well as all the subtests.	109
<b>3.</b>	Comparison between subjects and controls in scores of S.S.S showed a significant difference in total score as well as all the subtests.	110
<b>4.</b>	Comparison between subjects and controls in Parents Observation showed a significant difference regarding all subtests: intelligibility, articulation, social skills, and academic performance.	110
<b>5.</b>	Comparison between subjects and controls regarding the production of different syllables /a/, /i/, and /u/ showed a significant difference, with greatest difference in /i/ scores.	111
<b>6.</b>	Comparison between subjects and controls regarding the production of phonemes in different positions showed a significant difference.	111
<b>7.</b>	Comparison between subjects and controls regarding production of bisyllabic and polysyllabic showed a significant difference.	112
<b>8.</b> (a,b,c)	Comparison between subjects and controls in the production of different phonemes showed a significant difference in the production of all phonemes except /θ/.	112, 113
<b>9.</b> (a,b)	In production of different phonemes, the most difficult was the voiced /z/, and the least difficult was the /n/.	114
<b>10.</b> (a,b,c)	Comparison between subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed a significant difference for all phonemes except the /θ/.	115, 116
<b>11.</b>	Comparison between subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed that the most difficult was the voiced fricative /z/.	116
<b>12.</b>	Comparison between subjects and controls in oromotor movements showed no significant difference.	117
<b>13.</b>	Comparison between subjects and controls in oral praxis showed no significant difference for most items apart from complex and multi-sequential actions such as (whistle, tongue click, and throat clearance) which showed a significant difference.	117
<b>14.</b>	Comparison between subjects and controls regarding inconsistency showed a significant difference at both the word level as well as the sentence level.	118
<b>15.</b>	Comparison between subjects and controls regarding intelligibility showed a significant difference at both the word	118

	level as well as the sentence level.	
<b>16.</b>	Comparison between (less than) 5 years group in subjects and controls regarding the S.S.S. and its different items showed a significant difference.	119
<b>17.</b>	Comparison between (less than) 5 years group in subjects and controls regarding the parents' observation showed a significant difference in all parameters.	119
<b>18.</b>	Comparison between (less than) 5 years group in subjects and controls regarding the production of different syllables /a/, /i/, and /u/ showed a significant difference, with greatest difference in /i/ scores.	120
<b>19.</b>	Comparison between the less than 5 years group in subjects and control for different phonemic positions showed a significant difference for all positions; the middle position was the most difficult position.	120
<b>20.</b>	Comparison between the less than 5 years group in subjects and controls regarding production of bisyllabic and polysyllabic showed a significant difference.	121
<b>21.</b> (a,b,c)	Comparison between (less than) 5 years group in subjects and controls in the production of different phonemes showed a significant difference in the production of all phonemes except /θ/, /ð/and /ɹ/.	121, 122
<b>22.</b> (a,b)	Comparison between (less than) 5 years group in subjects and controls in the production of different phonemes showed that the most significant difference was for the voiced /z/, and the nasal /n/ phonemes.	123, 124
<b>23.</b> (a,b,c)	Comparison between (less than) 5 years group in subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed a significant difference for all the phonemes except for /θ/ , /ð/and / ɹ/.	125
<b>24.</b> (a,b)	Comparison between less than 5 year age group in subjects and controls regarding the oromotor power showed no difference.	126
<b>25.</b>	Comparisons between (less than) 5 years group in subjects and controls regarding the oral praxis no significant difference except for the oral whistle, tongue click, and throat clearance.	127
<b>26.</b>	Comparisons between (less than) 5 years group in subjects and controls regarding the inconsistency showed a significant difference at both the word and sentence level.	127
<b>27.</b>	Comparisons between (less than) 5 years group in subjects and controls regarding the intelligibility showed a significant difference at both the word and sentence level.	128
<b>28.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the S.S.S. and its different items showed a significant difference.	128
<b>29.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the parents' observation showed a significant difference in articulation and intelligibility, but no significant difference in social and academic performance.	129
<b>30.</b>	Comparison between (more than) 5 years group in subjects and	129

	controls regarding the production of different syllables /a/, /i/, and /u/ showed a significant difference, with greatest difference in /i/ scores.	
<b>31.</b>	Comparison between (more than) 5 years group in subjects and controls in initial, middle, and final. Initial has higher scores than final than middle positions. Middle position seems to be the most difficult position.	130
<b>32.</b>	Comparison between (more than) 5 years group in subjects and controls regarding production of bisyllabic and polysyllabic showed a significant difference.	130
<b>33.</b> (a,b,c)	Comparison between (more than) 5 years group in subjects and controls in the production of different phonemes showed a significant difference in the production of all phonemes except /θ/ and /n/.	131, 132
<b>34.</b> (a,b,c)	Comparison between (more than) 5 years group in subjects and controls regarding the production of different phonemes in sentences with varied complexity and length showed a significant difference for the following phonemes: /z/, /l/, /r/, /d/, /q/, /h/, /h/, /x/, /y/, with no significant difference in the rest of the phonemes.	133, 134
<b>35.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the oromotor power showed no significant difference.	135
<b>36.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the oral praxis showed no significant difference except in whistling.	135
<b>37.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the inconsistency on the word level and the sentence level showed that there was a significant difference.	136
<b>38.</b>	Comparison between (more than) 5 years group in subjects and controls regarding the intelligibility on the word level showed no significant difference, however on the sentence level there was a significant difference.	136
<b>39.</b>	Comparison of the males and females in subjects showed an age match.	137
<b>40.</b>	Comparison between males and females in S.S.S. showed no significant difference although the scores were lower for females than for males.	137
<b>41.</b>	Comparison between males and females in parents' observation showed no significant difference although the scores were lower for females than for males.	138
<b>42.</b>	Comparison between males and females in syllable production showed no significant difference although the scores were higher for females than for males.	138
<b>43.</b>	Comparison between males and females in different phonemic position showed no significant difference although the scores were higher for females than for males.	139
<b>44.</b>	Comparison between males and females in bisyllabic and polysyllabic showed no significant difference although the scores were higher for females than for males in bisyllabic word	139

	production.	
<b>45.</b> (a,b)	Comparison between males and females in the production of different phonemes showed no significant difference although the scores were higher for females than for males.	140
<b>46.</b>	Comparison between males and females in the production of different phonemes showed no significant difference although the scores were higher for females than for males.	141
<b>47.</b>	Comparison between males and females in the production of /z/ phoneme showed a significant difference although the scores were higher for females than for males.	141
<b>48.</b>	Comparison between males and females in the production of /n/ phoneme showed no significant difference although the scores were higher for females than for males.	142
<b>49.</b>	Comparison between males and females in the production of different phonemes in sentences with variable length and complexity showed no significant difference although the scores were higher for females than for males.	142
<b>50.</b> (a,b)	Comparison between males and females in the production of different phonemes in sentences with variable length and complexity showed no significant difference although the scores were higher for females than for males.	143
<b>51.</b>	Comparison between males and females in the oromotor power showed no significant difference.	144
<b>52.</b>	Comparison between males and females in the oral praxis showed no significant difference in most items except tongue click and throat clearance, although the scores were higher for females than for males.	144
<b>53.</b>	Comparison between males and females in the inconsistency showed no significant difference although the inconsistency was more for males than for females.	145
<b>54.</b>	Comparison between males and females in the intelligibility showed no significant difference although the females are more intelligible at the word level.	145
<b>55.</b>	Correlation between age and syllable production /a/ in subjects showed positive correlation.	146
<b>56.</b>	Correlation between age and syllable production /i/ in subjects showed positive correlation.	146
<b>57.</b>	Correlation between age and syllable production /u/ in subjects showed positive correlation.	147
<b>58.</b>	Correlation between age and initial position in subjects showed positive correlation.	147
<b>59.</b>	Correlation between age and middle position in subjects showed positive correlation.	148
<b>60.</b>	Correlation between age and final position in subjects showed positive correlation	148
<b>61.</b>	Correlation between age and production of polysyllabic words in subjects showed positive correlation.	149
<b>62.</b>	Correlation between age and whistle in subjects showed a positive correlation.	149

<b>63.</b>	Correlation between age and inconsistency in subjects showed high negative correlation at the word level.	150
<b>64.</b>	Correlation between age and inconsistency in subjects showed high negative correlation at the sentence level.	150
<b>65.</b>	Correlation between age and intelligibility in subjects showed positive correlation at the word level.	151
<b>66.</b>	Correlation between age and intelligibility in subjects showed positive correlation at the sentence level.	151
