## ***Acknowledgement***

*Thanks are given to ALLAH the source of all knowledge, by whose abundant aid this work has come to fruition.*

*It has been a great honor to do this work under the supervision of **Professor Dr. Sabry Abd El Aziz Gohar** Professor of Internal Medicine and Nephrology Faculty of Medicine, Ain shams University. I am greatly indebted to him for planning the subject, supervising the whole work, as well as reading and criticizing the manuscript. I will never forget his unlimited help, continuous support, kind encouragement, constructive criticism and wise guidance. To him words of praise are not sufficient and I am really greatly indebted to him.*

*I would like also to express my sincere gratitude and appreciation to **Assistant Professor Dr. Hayam Mohamed Aref**, Assistant Professor of Internal medicine and Nephrology, Faculty of Medicine, Ain Shams University, for her helpful guidance, valuable advice, meticulous care, great effort and generous help in this work. To her I shall be forever grateful.*

*Besides, I would like to express my gratitude and appreciation to my mother, father, sister, husband and son for their unlimited support and care. Moreover, I would like to thank my colleagues and friends Tahani Elsayed and Mohamed Abd El Fattah for their great help.*

# **List of Abbreviations**

ACEIs	Angiotensin-Converting Enzyme Inhibitors
ACS	Abdominal Compartment Syndrome
ADH	Antidiuretic Hormone
ADQI	Acute Dialysis Quality Initiative
AKI	Acute Kidney Injury
AKIN	Acute Kidney Injury Network
ALT	Alanine Transferase
ANCA	Anti-Neutrophil Cytoplasmic Antibody
APP	Abdominal Perfusion Pressure
ARBs	Angiotensin II Receptor Blocker.
ARF	Acute Renal Failure
ATIN	Acute Tubulointerstitial nephritis
ATN	Acute Tubular Necrosis
BUN	Blood Urea Nitrogen
CBC	Complete Blood Count
CGN	Crescentic Glomerulonephritis
CNS	Central nervous system
CrCl	Creatinine Clearance
CRRT	Continuous Renal Replacement Therapy
CT	Computed Tomography
DIC	Disseminated Intravascular Coagulopathy

FENa	fractional excretion of sodium
FG	Filtration Gradient
GBM	Glomerular Basement Membrane
GFR	Glomerular Filtration Rate
GN	Glomerulonephritis
Gro- $\alpha$	Human Growth-Related Oncogene- $\alpha$
HES	Hydroxyl-Ethyl Starch
HSP	Henoch-Schonlein Purpura
HUS	Hemolytic Uremic Syndrome
IAH	Intra-abdominal Hypertension
IAP	Intra-abdominal Pressure
ICNARC	Intensive Care National Audit and Research Centre
ICU	Intensive Care Unit
IL-18	Interleukin 18
IVP	Intra-vesical pressure
KC	Keratinocyte-derived chemokine
KDIGO	Kidney Diseases Improving Global Outcomes
KIM-1	Kidney Injury Molecule-1
KUB	Kidneys, ureter bladder
LDH	Lactate Dehydrogenase
MAP	Mean arterial blood pressure
MCP-1	Monocyte chemo attractant protein-1

MM	Multiple Myeloma
MRA	Magnetic Resonance Angiography
MPGN	Membrano-Proliferative Glomerulonephritis
NGAL	Neutrophil Gelatinin-Associated Lipocalin
NHE3	The sodium/hydrogen exchanged isoform 3
NKCC2	Sodium/potassium chloride cotransporter
NSAIDs	Non-Steroidal Anti-Inflammatory Drugs
NV	Necrotizing Vasculitis
PG	Prostaglandin
PIGN	Postinfectious Glomerulonephritis
PSGN	Post-Streptococcal Glomerulonephritis
RPGN	Rapid Progressive Glomerulonephritis
RRT	Renal Replacement Therapy
SCr	Serum Creatinine
SIRS	Systemic Inflammatory Response Syndrome
SLE	Systemic Lupus Erythematosus
SPSS	Statistical Package for Special Science
TMA	Thrombotic Microangiopathy
TTP	Thrombotic Thrombocytopenic Purpura
UO	Urine Output
WHO	World Health Organization
WSACS	World Society of the Abdominal Compartment Syndrome

## List of Figures

Figure number	Figures	Page number
1	Pathophysiology of AKI	15
2	Injury and repair to the epithelial cell of the kidney with ischemia/reperfusion	17
3	Complete urinalysis as a tool for D.D. of AKI	24
4	Algorithm for the diagnostic approach to a patient with suspected AKI	33
5	Frequency of pathologic diagnoses recorded in renal biopsies obtained for the diagnosis of AKI, adapted from the Italian registry.	42
6	Common causes of AKI in ICU patients	44
7	Components of intra-abdominal hypertension (IAH) management.	75
8	Intra-abdominal hypertension (IAH)/ abdominal compartment syndrome (ACS) medical management algorithm.	81
9	A: closed needle-free revised method for measurement of intra-abdominal pressure. B: Mounted patient view of the device and close up of manifold and conical connection pieces	96
10	Shows causes of ICU admission in both studied groups.	106
11	Shows correlation between IVP1 and HB% among patients in group 1.	115
12	Shows correlation between IVP1 and AST among patients in group 1.	116

13	Shows correlation between IVP1 and INR among patients in group1.	117
14	Shows correlation between IVP1 and BMI among patients in group1.	118
15	Shows correlation between IVP1 and PH0 among patients in group1.	119
16	Shows correlation between IVP1 and PH1 among patients in group1.	120
17	Shows correlation between IVP1 and HCO <sub>3</sub> 0 among patients in group1.	121
18	Shows correlation between IVP1 and RRT among patients in group1.	122
19	Shows correlation between IVP1 and Cr0 among patients in group1.	123
20	Shows correlation between IVP1 and Cr1 among patients in group1.	124
21	Shows correlation between IVP1 and Cr2 among patients in group1.	125
22	Shows correlation between IVP1 and PO2 1 among patients in group 2.	126
23	Shows correlation between IVP1 and exposure to surgery prior to ICU admission among patients in group1.	127
24	Shows correlation between IVP1 and degree of ascitis among patients in group1.	128
25	Shows correlation between IVP1 and presence of sepsis among patients in group1.	129
26	Shows correlation between IVP1 and volume of fluid therapy given per 24 hours among patients in group1.	130

27	ROC curve of IVP against admission Cr (Cr0) at the level of 1.5mg/dl for Cr0	131
28	ROC curve of IVP1 against follow up Cr (Cr1) at the level of 1.5mg/dl for Cr1	132

3	RIFLE and Acute Kidney Injury Network (AKIN) Definition and Staging of Acute Kidney Injury	8
4	Major causes of pre-renal AKI	11
5	Intrinsic renal causes of AKI	12
6	Approach to AKI	19
7	Causes of anuric AKI	23
8	Urine indices used in the differential diagnosis of prerenal acute kidney injury and acute tubular necrosis	28
9	Summary of Novel biomarker in AKI	39
10	Baseline laboratory investigations recommended for patients with AKI.	49
11	Further specialised investigations that may be required in patients presenting with AKI and who do not have a clearly defined precipitant for the initial injury.	50
12	Definitions Regarding IAH and ACS	58
13	Conditions Associated With IAH and ACS	60
14	Reported Incidence of IAH and ACS in Literature	64
15	Shows the comparison in demographic data between the studied groups.	105
16	Shows the comparison in laboratory findings between the studied groups.	105
17	Shows different causes of I.C.U admission in the 40 studied cases	106
18	Shows prevalence of exposure to surgery before ICU admission in the 40 studied cases.	107
19	Shows distribution of sepsis occurrence in the 40 studied cases.	107

20	Shows number of patients who received renal replacement therapy (RRT) in the studied population.	108
21	Shows number of patients who received mechanical ventilation in the 40 studied cases.	108
22	Shows distribution of ascites in the studied cases	108
23	Comparison in ABGs between group 1 and group 2 on admission and after 48 hours as follow up.	109
24	Shows comparison in intra- vesical pressure between group 1 and group 2 on admission and after 48 hours as follow up.	109
25	Shows outcome of renal function (group1)	110
26	Correlation of IVP1 with the different studied numerical variables in group 1 using Pearson`s test.	111
27	Correlation of IVP1 with the different studied numerical variables in group 2 using Pearson`s test.	112
28	Correlation of IVP1 with the different studied nominal variables in group 1 using Spearman`s test.	113
29	Correlation of IVP1 with the different studied nominal variables in group 2 using Spearman`s test.	113
30	Correlation of IVP1 with volume of fluid therapy given per 24 hrs. in cases of group 1.	114

## **Introduction**

Once considered mostly a post-surgical condition, intra-abdominal hypertension (IAH) and the abdominal compartment syndrome (ACS) are now thought to increase morbidity and mortality in many patients receiving medical or surgical intensive care. Animal data and human observational studies indicate that oliguria and acute kidney injury are early and frequent consequences of IAH/ACS and can be present at relatively low levels of IAP. Among medical patients at particular risk are those with septic shock and severe acute pancreatitis, but the adverse effects of IAH may also be seen in cardiorenal and hepatorenal syndromes. Factors predisposing to IAH/ACS include sepsis, large volume fluid resuscitation, polytransfusion, mechanical ventilation with high intrathoracic pressure, and acidosis, among others.(4)

Physical examination, with sensitivity of 40 to 60.9%, is unreliable for diagnosing IAH/ACS.(8)

Although a variety of direct and indirect techniques for measuring IAP have been developed and validated over the years,(9) transduction of urinary bladder pressure through an indwelling urinary catheter remains

the gold standard for measuring and monitoring IAP. The bladder pressure method has been shown when performed appropriately to strongly correlate with IAP measured directly, (1) while remaining cost-effective and safe, without any increased risk of catheter-associated urinary tract infection.(2)

In many institutions, screening patients at risk of developing IAH and serial monitoring of IAP every 4 to 6 hours is common practice.(3)

Several non-surgical methods can help reduce IAP. The role of renal replacement therapy for volume management is not well defined but may be beneficial in some cases. IAH/ACS is an important possible cause of acute renal failure in critically ill patients and screening may benefit those at increased risk.(4)

In recent years both IAH and ACS —the severe, advanced stage of IAH characterized by organ system failure— have increasingly been associated with morbidity and mortality in critically ill patients. (6)

Although multiorgan failure is also well recognized in ACS, what is much less appreciated and what some recent data suggest is that kidneys may be particularly at risk with much lower levels of IAP than would be seen in fully established ACS. These findings indicate that acute renal failure (ARF) resulting, at least in part, from lesser degrees of IAH may be present in a much larger population of critically ill patients than believed previously. (7)
