2017

ACKNOWLEDGEMENT

My greatest gratitude to **ALLAH** whose guidance and support were the main motive behind accomplishing this work.

I would like to express my profound gratitude and sincere appreciation to *Prof. Dr. Adel Mohamad Saeed*, Professor of Chest Diseases, Faculty of Medicine, Ain Shams University, for his great help and support and gentle guidance and insistence. Without his help, this work would have never been accomplished.

I would also like to express my appreciation to *Dr. Riham M. Hazem M. Raafat*, Lecturer of Chest Diseases, Faculty of Medicine, Ain Shams University, for her continuous help, guidance and encouragement.

Last but not least I would like to express my deep thanks and gratitude to all *family members* for supporting me and pushing me forward all the time.

Eman Mohamed

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قالوا

سبحانك لا علم لنا
إلا ما علمتنا إنك أنت
العليم العظيم

صدق الله العظيم

سورة البقرة الآية: ٣٢

Abstract

Background: Tuberculosis (TB) is an infectious bacterial disease caused by *Mycobacterium tuberculosis*, which most commonly affects the lungs. It is transmitted from person to person via droplets from the throat and lungs of people with the active respiratory disease. Approximately 9.4 million new cases and 1.7 million deaths were encountered per year worldwide.

Aims: The aim of this work is to study the relation between Addiction and the disease (tuberculosis) in Newly Diagnosed Pulmonary Patients attending to outpatient clinic or admitted to Abbasia Chest Hospital between August 2015 to April 2016.

Methodology: This is a prospective study, which was conducted upon addict patients who were diagnosed as new cases of pulmonary tuberculosis (positive sputum for ZN stain) at different departments and intensive care units in Abbasia chest hospital during eight months from August 2015 to April 2016 to detect the relation between Addiction and the disease (tuberculosis).

Results: In this study, all the patients were low socioeconomic class males (31% prisoners) who were diagnosed as new cases of pulmonary tuberculosis. The mean of age was 33.7 years, more than half of them were single also more than half of them were sever smokers.

Conclusion: There is some degree of relationship between addiction and incidence and severity of pulmonary tuberculosis regarding radiological findings in chest X-ray, HIV infection and mortality rate among cases of the study.

Recommendations: Drug addiction is a major public health problem that needs to be studied from different aspects. Studies are needed in different regions of the community, ages, socioeconomic and educational standards, reasons for which drug addicts started addiction, awareness of health risk and the reasons for drug addiction.

INTRODUCTION

Tuberculosis (TB) is an infectious bacterial disease caused by *Mycobacterium tuberculosis*, which most commonly affects the lungs. It is transmitted from person to person via droplets from the throat and lungs of people with the active respiratory disease (*Global tuberculosis report 2013*).

Approximately 9.4 million new cases and 1.7 million deaths were encountered per year worldwide (*Rudeeaneksin et al., 2012*).

Tuberculosis (TB) continues to be one of the major causes of death and disability. The Global Burden of Disease Study estimated that in 2004 TB was responsible for 2.5% of global mortality (among men 3.1%; women 1.8%) and 2.2% of global burden of disease (men 2.7%; women 1.7%), with more impact in developing countries (*WHO, 2008*).

The Center for Disease Control and Prevention (CDC) states that one-third of the world's population is infected with MTB resulting in annually approximately 1.80 million deaths worldwide (*WHO, 2011*).

Tuberculosis (TB) remains a major public health burden in many developing countries. Approximately 1.3

billion people smoke tobacco products and most of them live in low- or middle-income countries, where the burden of TB is also very high (*Shafey et al., 2004*).

Drug addiction is the use of Drugs in ways, which are not medically approved because they cause strong feeling of euphoria or they alter perception of the user leading to physical and psychological dependence (*Dhingra et al., 2008*).

The physiological effects of drug use, along with the environment and risk behaviors of drug users, may all contribute to the high prevalence of TB among drug users. A number of in vitro studies have demonstrated deleterious effects of drug use on the immune system (*Friedman et al., 2003*).

Drug addiction in tuberculosis can lead to not only the spread of tuberculosis but also of other diseases due to their immune compromised status (*Abalkhail, 2001*).

Drug users and injection drug users in particular, have driven TB epidemics in a number of countries (*Robert et al., 2009*).

Drug use is frequently associated with a number of epidemiological factors, including tobacco use, homelessness, alcohol abuse, and incarceration, that confer additional risk of TB (*Niveau, 2006*).

Current evidence shows that cannabis smokers are more at risk of developing a range of infective lung conditions (*Nguyen et al., 2010*).

Cannabis smokers are at increased risk of developing legionnaires' disease. Several studies report cannabis smokers developing tuberculosis (*Oeltmann et al., 2004*).

AIM OF THE WORK

The aim of this work is to study the relation between Addiction and the disease (tuberculosis) in Newly Diagnosed Pulmonary Patients attending to outpatient clinic or admitted to Abbasia Chest Hospital between August 2015 to April 2016.

PULMONARY TUBERCULOSIS

Definition

TB is an infectious disease caused by the bacillus *Mycobacterium tuberculosis*. It typically affects the lungs (pulmonary TB) but can affect other sites as well (extra pulmonary TB). The disease is spread in the air when people who are sick with pulmonary TB expel bacteria, for example by coughing. In general, a relatively small proportion of people infected with *M. tuberculosis* will develop TB disease; however, the probability of developing TB is much higher among people infected with HIV. TB is also more common among men than women, and affects mostly adults in the economically productive age groups (*Global Tuberculosis Report, 2013*).

History of Tuberculosis

Tuberculosis (TB) has a long history. It was present before the beginning of recorded history and has left its mark on human creativity, music, art, and literature; and has influenced the advance of biomedical sciences and healthcare. Its causative agent, *Mycobacterium tuberculosis*, may have killed more persons than any other microbial pathogen (*Daniel, 2006*).
