SCFMC STUDIES OF SOME SELECTED HYDROGEN BONDED SYSTEMS

A THESIS

Presented to Faculty of Science, Menoufia University, Shebin El-Koom

BY
AMANI ABD EL-AZIZ SHALABI
B.Sc.

In partial fulfillment of the Requirements for The Degree of Master of Science Physical and Inorganic Chemistry

Supervised By

PROF. DR. FARAG AHMED ALI

Prof. of Inorganic Chemistry Menoufia University

PROF. DR. AHMEN SAID SHALABI

Prof. of Theoretical Chemistry
Benha University

DR. AHMED M. EL-NAHAS

Lecturer of Inorganic Chemistry Menoufia University

1996

Lecturer of Inorganic Chemistry
Menoufia University

A. Urah

﴿ رَبِنَا لَا تَوَاهَدُنَا إِنْ نَسِينًا أَوِ أَهُطَأْنَا رَبِنَا وَلَا تَحْمِلُ عَلَيْنَا رَبِنَا عَلَيْ الذينَ مِنْ قَبِلْنَا رَبِنَا وَلا تَحْمِلُنَا مِا لَا طَاقَةَ لَنَا بِهُ وَاعْفُ عَنَا وَاغْفُر لَنَا وَارْحَمِنَا

أنت مولانا فانصرنا على القوم الكافرين ﴿

صدق الله العظيم

ACKNOWLEDGEMENT

I am deeply thankful to *GOD* by the grace of whom the progress of this work was possible.

I am also indebted with sincere gratitudes to *PROF. FARAG*A.ALI, Prof. of Inorganic chemistry, Faculty of Science, El-Menoufia
University for encouragement and interest.

My deeply thanks go to *PROF. AHMED S. SHALABI* Prof. of Theoretical Chemistry, Faculty of Science, Banha University for Suggesting the problem, furitful discussion and helpful guiding.

I would like to express my deepest gratitude to *DR*. *AHMED M*. *EL-NAHAS* for his guidance, encouragement, and friendship throughout the progress of this research.

My deepest thanks go to my family especially my hasband DR. MAGDI A. MAKLOOF for their encouragement throughout the progress of this work.

Amani A. Shalabi

NOTES

Besides the work carried in this thesis, the candidate had attended post-graduate courses for one year in Physical and Inorganic Chemistry, in covering the following topics:

- Solid state.
- Microanalysis.
- Electrochemistry.
- Surface chemistry.
- Theory of complexes.
- Spectroscopy.
- Essay.
- Statistics.
- Computer.
- English.

Head of Chemistry Department

Prof. Dr. IBRAHIM F. ZEID

LIST OF ABBREVIATION

ESR : Electron spin resonance

LMO : Localized molecular orbital

CI : Configuration interaction

SCF : Self-consistent field

GVB : Generalized valence-bond.

CISD : Single and double excitation configuration interaction.

DZP : Double - zeta puls polarization

TZ2P : Triple zeta puls double polarization

BDE_s : Bond dissociation energies

CCSD : The single and double excitations couple-cluster

CCSD(T): The single, double and perturbative triple excitations

coupled cluster

IRC : Intrinsic reaction coordinate

MEP : Minimum energy path

MNDO . Modified Neglect of Diatomic Differential Overlap.

CNDO : Complete Neglect of Differential Overlap.

INDO : Intermediate Neglect of Differential Overlap.

NDDO : Neglect of Diatomic Differential Overlap.

MINDO/3: Is a modified INDO mothod.

MRBW: Multireference Brillouim-Wigner.

VB : Valence Bond theory

MO : Molecular Orbital theory

Chapter 1 INTRODUCTION

1.1- Literature Survey:

The topology of the potential energy surface of Si₂H₂ reveals some very interesting and intriguing features, both in comparison with C₂H₂ as well as in its own right. The contrasting chemical behavior of silicon and carbon has been known, and a variety of reasons put forth in explanation. Kutzelnigg⁽¹⁾ published a pertinent paper in 1984 that provided an excellent discussion of silicon bonding from the point of view of periodic terends. Chemists have historically pointed all too readily to the availability of d-orbitals in the valence shell of silicon when explaining why it behaves differently than carbon, and quite understandably since it is the valence electrons that engage in bonding and other activities that constitute chemical behavior. However, ab initio calculations have shown that the contribution of silicon d-orbitals to the molecular orbitals is very small. Kutzelnigg(1) suggests that it is rather a difference in the cores of carbon and silicon that distinguishes them. First-row elements such as carbon have only s-orbitals in their cores, while the second - row elements additionally have p-orbitals. Because of carbon's totally symmetric core, its 2s and 2p valence orbitals have about the same spatial extension. This establishes an ideal environment for s-p hybridization that does not exist for silicon. Because the 3s orbital is contracted compared to the 3p, silicon's 3p orbitals carry a large amount of the responsibility in forming bonds, while the 3s orbital is more favored for lone-pair orbitals. Thus silicon exhibits unbalanced hybridization, quite different from the concept of equivalent hybrids. In fact, nonhybridization of the silicon atomic orbitals may be a better representation^(2, 3). Two other periodic trends that distinguish carbon and silicon are silicon's greater affinity for the divalent state and its smaller electronegativity. These factors combine to provide a clear distinction between the chemistry of carbon and silicon.
