

**Recent advances in prophylaxis and
management of corneal ectasia
after Laser In Situ Keratomileusis**

Essay

Submitted in partial fulfillment for master degree of
ophthalmology

By

John KeddisShehata

(M.B.B.CH)

Under supervision of

Prof. Dr: FatmaShafik El Hennawi

Professor of ophthalmology

Faculty of medicine

Ain shams university

DR: Al-Hussein Ali Swelem

Lecturer of ophthalmology

Faculty of medicine

Ain Shams university

2014

Acknowledgements

After giving all thanks to ALLAH, I would like to acknowledge the contribution of the following people and organizations to my essay.

I have been particularly fortunate to have been associated with two of my idols and sincerely appreciate their efforts on my behalf. And I would like to express my deepest gratitude for their continuous help throughout the whole work, their kind supervision and advice, and their kind support.

Prof. Dr: *Fatma Shafik El Hennawi*; Professor of ophthalmology

Dr. Dr: *Al* ; *Head of Ophthalmology*

I am deeply thankful for my wife for her great support and for the encouragement and prayers of my friends and family who persevered with me through every step of the work.

Chapter 1- Biomechanical and biological responses to LASIK.

1. Diagram illustrating layers of the cornea.....4
2. Young's modulus is calculated using the slope of stress over strain6
3. Major biomechanical loading forces in the cornea and a model of biomechanical central flattening associated with disruption of central lamellar segments.....9
4. The ocular response analyzer (ORA).....11
5. corneal wound healing events of particular relevance to corneal refractive surgery.....13

Chapter 2- prophylaxis of post LASIK ectasia

6. corneal topography of a male 23years old with advanced keratoconus25
7. corneal topography of a female 19 years with forme fruste keratoconus25
8. corneal topography of male 32 years old with pellucid marginal degeneration26
9. corneal topography of CL warpage immediately and 1 wk after removal26
10. The Orbscan topography in the right eye (a) and left eye (b). Disparity was noted between the anterior and posterior corneal surface elevations.....28

11. corneal topography map with rotating scheimpflug, top left ant curvature,top right pachymetry, down left ant elevation, down right post elevation.....	31
12. corneal topography maps showing the posterior corneal elevation with scanning slit-beam corneal tomography.....	32
13. corneal topography map with ant segment OCT.....	32
14. crneal imaging with high-frequency ultrasound.....	34
15. corneal pachymetry with the Pentacam-Scheimpflug.....	34
16. corneal pachymetry with Visante OCT	35
17. corneal pachymetry with Orbscan IIz	35
18. Riboflavin solution applied over the bare stroma without contact with the LASIK flap for 60 seconds.....	42
19. Flap is repositioned, and the riboflavin-yellow tinge is visualized in the corneal stroma prior to application of higher fluence ultraviolet light.....	42

Chapter 3- Diagnosis of post LASIK ectasia

20 side view of the left eye of 23 yrs old male, 16 months after LASIK showing protrusion of the cornea.	44
21 pentacam topography map of the Rt eye of a 32 years old patient with keratectasia 13 months after lasik	45

22 Three-year postoperative topographic corneal map of a patient. corneal thinning in the center treated area, with a steepening and a posterior corneal bulge is evidenced	46
23 Eighteen-month postoperative topographic corneal map of the right eye of a 29 years old male patient inferior corneal steepening	47
24 Ant seg OCT of the right eye of 24 yrs old female 12months post LASIK.....	47
25. Ant seg OCT shows a post-LASIK cornea with ectasia. The cornea is only 250 microns thick at the thinnest point, which is half the thickness of normal cornea	48
26. Corneal Hysteresis of 15 eyes pre- and post-LASIK.....	49

Chapter 4- Management of postoperative ectasia.

27 . First rigid lens of Rose K design fitted on the ectatic cornea at 6 months post Lasik surgery wearing	52
28. First rigid lens of Rose K design on the ectatic cornea at 2 year post Lasik surgery, showing too much compression at the apex.	53
29. New rigid lens of Rose K design with a steeper base curve fitted on the ectatic cornea at 2 Years post Lasik surgery..	53
30. Post LASIK ectasia patient wearing sclera CL	54
31. Corneal Cross-linking	56
32. Slitlamp photograph after one week of Intacs SK implantation.....	60
33. Corneal imaging using Visante™ OCT after one week of Intacs SK implantation.....	60
34. Topography map of the right eye at A) presentation, B) 3 days after Intacs SK implantation, C) 4 weeks after Intacs SK implantation, and D) 8 months after collagen cross-linking treatment.....	62

35. Topography map of the left eye at A) presentation, B) 3 days, and C) 7 months after Intacs SK implantation and collagen cross-linking treatment.....	62

Introduction

Recent advances in prophylaxis and management of corneal ectasia after Laser In Situ Keratomileusis

Post-LASIK Ectasia can be defined as a Progressive non inflammatory corneal thinning after surgery resulting in irregular topographic steepening and the resultant irregular astigmatism. And associated with inferior topographic steepening of 5 diopters (D) or greater compared with immediate postoperative appearance.

Post LASIK ectasia is associated with a loss of 2 or more Snellen lines of uncorrected visual acuity. And a change in manifest refraction of 2 D or more in either sphere or cylinder. The incidence of ectasia after refractive surgery is not known precisely, but have been estimated to be 0.2% to 0.66% in recent studies.

Aim of the Study

The aim of this work is to review the most recent strategies for prophylaxis and management of corneal ectasia after keratorefractive surgery.

BIOMECHANICAL AND BIOLOGICAL ASPECTS OF THE CORNEA IN RESPONSE TO LASIK

I. Corneal Biomechanics

Foundations of the biomechanical response:

1. Cornea Anatomy and Structure

The cornea is the transparent anterior portion of the eye through which the iris and pupil can be visualized. The transparency and curvature of the cornea are essential to good vision. The cornea and lens make up the refractive elements of the eye, with the cornea providing approximately $3/4$ of its refractive power (≈ 45 D). The cornea is thickest at the limbus (0.6–0.8 mm) and thins centrally (0.5–0.6 mm), with an aspheric curvature. The hydrated cornea is composed of $\approx 80\%$ water. A hydrophilic proteoglycan extracellular matrix maintains corneal hydration by drawing water into the cornea from the tear film anteriorly and the aqueous posteriorly through a fluid pump mechanism. (*DelMonte et al 2011*)

The cornea is made up of five layers (**fig 1**) and is mainly composed of collagen. Listed from anterior to posterior, the layers are: Epithelium, Bowman's membrane, stroma, Descemet's membrane, and endothelium. The epithelial layer is very thin, with a basement membrane composed of type-IV collagen, and contributes little to the overall strength and curvature of the cornea. Bowman's layer is a thin (8–12 μm), tough layer of irregularly arranged type V collagen fibers that protects the stroma. The corneal stroma makes up approximately 90% of the corneal thickness

and is composed of highly organized collagen fibrils (type I > type III, type V) with their orientation maintained by a proteoglycan matrix. Collagen fibrils are organized into bundles called lamellae which vary in number across the cornea from 300 centrally to 500 at the limbus. The anterior lamellae of the stroma take random courses from the limbus, often interweaving with and terminating in the collagen of Bowman's membrane. Posterior lamellae have a more ordered organization, running from limbus-to-limbus along the superior-inferior or nasal-temporal meridians. At the limbus, stromal and scleral collagen interweave in a circumferential manner, which accounts for an increase in corneal thickness in this region. Descemet's membrane is composed of type IV collagen and is flexible and extensible, preventing the transmission of stromal stress to the endothelium. (*DelMonte et al 2011*)

Fig 1 Diagram illustrating layers of the cornea. (*DelMonte et al 2011*)
