

**Serum Dehydroepiandrosterone Sulphate
(DHEA-S) Concentration and Serum
Prolactin concentration in Female Patients
with Chronic Idiopathic Urticaria (CIU)**

Thesis

Submitted for partial fulfillment of master
degree in internal medicine

By

Annie Arek Haig Ohanessian
MB.,Bch., (Ain Shams university)

Under supervision of

Professor/ Mohamed Kamel Sabry

Professor of Internal Medicine, Allergy and Clinical
Immunology.
Faculty of Medicine-Ain Shams University.

Dr/ Mohamed Nazmy Faris

Assistant Professor of Internal Medicine, Allergy and
Clinical Immunology.
Faculty of Medicine-Ain Shams University.

Dr/ Nermine Abd Elnour Melek

Lecturer of Internal Medicine, Allergy and Clinical
Immunology.
Faculty of Medicine-Ain Shams University.

2012

Acknowledgment

Thanks first and last to God for His guidance, support and care in every step in our lives.

*It is a great pleasure to acknowledge my deepest gratitude to **Professor Dr/ Mohamed Kamel Sabry**, Professor of Internal Medicine, Allergy and Clinical Immunology. Faculty of Medicine-Ain Shams University for his supervision, guidance and help.*

*I have the greatest pleasure to express my gratitude to **Dr/ Mohamed Nazmy Faris** Assistant professor of Internal Medicine, Allergy and Clinical Immunology, Faculty of Medicine-Ain Shams University, for his help, encouragement, supervision and support.*

*In addition, I have the greatest honor to express my deep thanks to **Dr/ Nermine Abd Elnour Melek** lecturer of Internal Medicine, Allergy and Clinical Immunology Faculty of Medicine-Ain Shams University, for her supervision, endless support, encouragement and great assistance.*

*Special thanks, gratitude and gratefulness to **Dr.Naglaa Arafa**, Assistant Professor of Community, Environmental and*

Acknowledgment

Occupational Medicine, Faculty of Medicine, Ain Shams University for perfectly performing the statistical part of the work.

Lastly, I have to express my appreciation to my parents, as without their support and help this work would not have been fulfilled.

List of Abbreviations

ACC	Anterior cingulate cortex
AIU	Autoimmune urticaria
ANOVA	Analysis of variance
ASST	Autologous serum skin test
C2	Complement 2
C5	Complement 5
CIU	Chronic idiopathic urticaria
CNS	Central nervous system
CU	Chronic urticaria
DHEAS	Dehydroepiandrosterone sulphate
FcεRI	IgE receptors
FcεRIα	α-chain of the high-affinity IgE receptor
HLADR4	Histocompatibility complex class II allele (DR4)
Ig	Immunoglobulin
IgE	Immunoglobulin E
IgG	Immunoglobulin G
IL-1	Interleukin-1
IL-4	Interleukin-4
IL-8	Interleukin-8

IQR	Interquartile range
------------	----------------------------

List of Abbreviations

LT	Leukotrienes
LTC₄	Leukotriene C₄
MBP	Major basic protein
NK	Natural killer
NSAIDs	Non-steroidal anti-inflammatory drugs
PCP	Primary care physician
PGD₂	Prostaglandin D₂
PL	Placental lactogens
PLP	Prolactin-like proteins
PRL	Prolactin Hormone
PRP	PRL-related proteins
RA	Rheumatoid arthritis
RDBPC	Randomized, double-blind placebo controlled
SD	Standard deviation
Stat5	Signal Transducers and Activators of Transcription protein 5
SLE	Systemic lupus erythematosus
Th1	T helper cell
TNF-α	Tumor necrosis factor alpha
ug/dL	Microgram per deciliter

Introduction

Urticaria is a common clinical disorder; pathophysiology is based on mediators release from mast cells, predominantly histamine and subsequently an inflammatory response (*Schocket, 2006*). However, in most cases, aetiology of chronic urticaria is unknown; it is referred to as chronic idiopathic urticaria (CIU). Some cases of chronic idiopathic urticaria (CIU) have histamine-releasing IgG autoantibodies in their blood. This disease subgroup is called “autoimmune urticaria”. The autologous serum skin test (ASST) is the best in vivo clinical test for the diagnosis of autoimmune urticaria (*Kulthanan et al., 2006*).

Chronic urticaria is approximately twice as common in females as in males, suggesting that sex differences in hormone patterns may play a role in this phenomenon. Extensive evidence suggests that, abnormalities in sex hormones metabolism and/or

secretion may modulate activity of some immunologic diseases (*Schwartz, 2002*).

Receptors for sex hormones have been identified on various immune and inflammatory cells suggesting that these hormones influence directly their functions. Sex hormones are involved in immune response by regulation of maturation, survival, activation and function of diverse immune cells; generally with estrogens as enhancers at least of the humoral immunity and androgens and progesterone as natural immune-suppressors. (**Tanriverdi et al., 2003**)

It has been reported that adrenal androgens, dehydroepiandrosterone (DHEA) and its ester dehydroepiandrosterone sulphate (DHEA-S) show immunomodulatory properties and their deficiency has been associated with immune-mediated diseases, including systemic lupus erythematosus,

rheumatoid arthritis and autoimmune thyroiditis, which predominantly affect women (*Dillon, 2005*). Prolactin which is a hormone released by the pituitary gland to stimulates breast development and milk production in women. is a common mediator of the neuro-endocrine-immune network as well (*De Bellis et al., 2005*).

Prolactin and dehydroepiandrosterone sulfate (DHEA-S) exert multiple immunomodulatory effects (*Schwartz, 2002*) and their circulating levels change in a contrasting manner in the course of some immune-inflammatory diseases. Only some scarce information is available on the hormonal environment in chronic urticaria (CU) patients. (*Brzoza et al., 2007*).

The aim of this study :

To evaluate serum concentration of DHEA-S and Prolactin in female patients suffering from CIU showing positive and negative response to autologous serum skin test (ASST) as compared with the healthy subjects. In addition, to assess the relationship between serum concentrations of prolactin and DHEA-S in such patients.

Chapter I

Chronic idiopathic urticaria

1.1. Epidemiology:

Urticaria is a common dermatologic condition, characterized by erythematous wheals caused by mast cell degranulation and histamine release, approximately 15% to 25% of the population is affected at some point in their lifetime causing a significant disturbance in quality of life. (*Kaplan, 2003*)

Chronic urticaria (CU) refers to continuous or intermittent wheals existing for 6 or more weeks that may be caused by physical stimuli, allergy, systemic illness, drugs, or infection, however, in the majority of cases (80%-90%), no eliciting cause is identified and recently, researches show no evidence of an exogenous allergen as the cause of CU which is labeled chronic idiopathic urticaria (CIU). (*Kaplan et al, 2009*)

As many as 30% to 50% of patients with CIU are thought to have an autoimmune cause of histamine release leading to recurrent hives. (*Kaplan, 2003*)

CIU is twice as common in women as in men. Although persons of any age may experience CIU, it occurs most frequently after adolescence, with the highest incidence in young adults in the adult population (*McGirt et al., 2006*).

1.2. Clinical picture:

Urticaria is characterized by the rapid appearance of itchy wheals with duration of usually 1–24 h; it has diverse presentations ranging from occasional localized wheals to widespread recurrent whealing with angioedema. (*Zuberbier et al, 2007*)

Chronic urticaria (CU) is defined as recurrent urticarial lesions characterized by short-lived itchy wheals and swellings during 6 weeks. (*Grattan et al, 2002*).
