

ONCOPLASTIC SURGERY OF THE BREAST

Essay

*Submitted for partial fulfilment of the
Master Degree in General Surgery*

By

Anan Mohammed Alaa-El-Din Omar Ibrahim

M.B.,B.Ch. -Ain Shams University

Supervised By

Prof. Dr. Fateen Abd-Elmonem Anous

*Professor of General Surgery
Faculty of Medicine - Ain Shams University*

Dr. Ahmed Sobhy Elsobky

*Lecturer of General Surgery
Faculty of Medicine - Ain Shams University*

**Faculty of Medicine
Ain Shams University
2013**

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

﴿وَأَنْزَلَ اللَّهُ عَلَيْكَ الْكِتَابَ وَالْحِكْمَةَ وَعَلَّمَكَ مَا لَمْ
تَكُن تَعْلَمُ وَكَانَ فَضْلُ اللَّهِ عَلَيْكَ عَظِيمًا﴾

سورة النساء آية (١١٠)

صدق الله العظيم

*A thousand thanks and more to **Allah**, who made me who I am and always gives me more than what I deserve.*

*To my **Parents**, who started me off on the right path. Special thanks to them for their wisdom, strength, comfort, support, loyalty, and the love that flows endlessly from them.*

*I would like to gratefully acknowledge and thank sincerely **Prof. Dr. Fateen Abd El-Moneim Anous**, Professor of general surgery, Faculty of Medicine, Ain Shams University, for his encouragement and support throughout this work.*

*Particular thanks to **Dr. Ahmed Sobhy El-Sobky**, Lecturer of general surgery, Faculty of Medicine, Ain Shams University, who generously gave me his time, guidance and experience which helped me complete this work.*

*I certainly would not have accomplished this task without my **Sisters, Friends and Colleagues** who were always there for me and provided me with the inspiration and necessity to work hard on this essay.*

List of Tables	iv
List of Figures	v
Introduction	1
Aim of the work	4
Chapter (1): Aesthetic anatomy of the breast.....	5
Chapter (2): Pathology of breast cancer	28
Chapter (3): General management of breast cancer.....	40
Chapter (4): Oncoplastic techniques	81
Summary	148
References	151
Arabic Summary	--

List of Abbreviations

Abb.....	Description
ALND	Axillary lymph node dissection
AS.....	Areola sparing
BCT.....	Breast conservation therapy
BCS	Breast conservation surgery
BRCA 1	Breast cancer antigen 1
BRCA 2	Breast cancer antigen 2
CK.....	Cytokeratin
DCIS	Ductal carcinoma in situ
DIEP	Deep inferior epigastric perforator flap
DSEA	Deep superior epigastric artery
E2	Estrogen
ER	Estrogen receptor
FDA.....	US Food and Drug Administration.
FISH.....	Fluorescence in situ hybridization
GAP	Gluteal artery perforator flap.
HER2	Human epidermal growth factor receptor 2
IGAP.....	Inferior gluteal artery perforator flap.
IHC	Immunohistochemistry
LABC.....	Locally advanced breast cancer
LDMF.....	Latissimus dorsi muscle flap
MDOT	Modified double opposing tab flap.
MRM	Modified radical mastectomy
NAC	Nipple areola complex
NAS.....	Nipple areola sparing
NCI	National Cancer Institute
NOS.....	No otherwise specified

List of Abbreviations (Cont...)

PMRT	Post mastectomy radiotherapy
PR	Progesterone receptor
SGAP	Superior gluteal artery perforator flap.
SIEA	Superficial inferior epigastric artery flap
SLN	Sentinal lymph node
SLNB	Sentinel lymph node biopsy
SLNB	Sentinal lymph node biopsy
SPECT	Single photon emission CT
SSM	Skin sparing mastectomy
TGF	Tumour growth factor
TNM	Tumor-nodes-metastasis
TRAM	Transverse rectus abdominis myocutaneous flap
TUG	Transverse upper gracilis musculocutaneous flap.
VRAM	Vertical rectus abdominus myocutaneous flap

INTRODUCTION

Breast cancer (malignant breast neoplasm) is cancer originating from breast tissue most commonly from the inner lining of the ducts or the lobules that supply the ducts. Prognosis and survival rates vary greatly depending on the cancer type and staging.⁽¹⁾

Diagnosis of breast cancer and a treatment plan that includes mastectomy can profoundly affect the life of patients. Such patients have concerns about disfigurement and anxiety about their future lives. These concerns are addressed with reconstructive techniques that have been developed to provide not only a return to normal clothing and to their full activities, but also a restoration of beauty and femininity.⁽²⁾

Breast reconstruction is a surgical procedure that restores the shape of the breast after mastectomy. Different approaches for breast reconstruction include tissue expanders, implants, and autogenous tissue reconstruction or using a combination of both implants and autogenous tissue.⁽³⁾

Breast reconstruction now occupies an important place in the overall modern treatment plan for women who face mastectomy. The art of breast reconstruction has undergone commensurate evolution over the last 20 years. An ideal reconstructive technique should be safe, reliable, and reproducible,

with limited or no resultant long-term morbidity. Such a technique would replace the breast with tissue of similar texture, producing an aesthetic result indistinguishable from the natural breast.⁽⁴⁾

The optimal timing for breast reconstruction for patients with early stage breast cancer who are scheduled to undergo mastectomy and desire breast reconstruction depends on whether post-mastectomy radiation therapy will be needed. Immediate reconstruction offers the best aesthetic outcomes if post-mastectomy radiation therapy is not needed, however, if radiation therapy is required, delayed reconstruction is preferable to avoid potential aesthetic and radiation-delivery problems.⁽⁵⁾

Flap based breast reconstruction is a major procedure which prolongs the time of the operation and extends the recovery time to several weeks. In addition, other complications may also include poor wound healing, hernia, seroma, infection and tissue necrosis due to insufficient blood supply.⁽⁶⁾

Recovery from implant based reconstruction is generally faster than with flap based reconstructions but both take at least three to six weeks to recover and both require additional surgeries in order to construct a new areola and nipple. All recipients of these operations should avoid strenuous sports, overhead lifting and sexual activity during the recovery period.⁽¹⁾

Breast reconstruction using implants carries the possibility of significant complications such as infection, implant rotation and capsular contraction due to fibrous tissue formation around the implant compressing both the implant and breast tissue into a hard or unnatural shape. Correcting any of these complications may require additional surgery.⁽⁷⁾

Breast reconstruction with implants often requires the use of a tissue expander to create room for the implant before it can be placed because after mastectomy there is less skin remaining at the site of the breast than which originally existed. For an implant to be comfortably placed, the surgeon may first surgically insert a balloon like tissue expander under the chest muscle.⁽⁶⁾

Nowadays, the chief concern is primarily to control the disease. Modern treatment plans must entail decisions regarding reconstruction such as type of implants and flaps, as well as treatment of the skin envelope.⁽⁸⁾

AIM OF THE WORK

The aim of this essay is to revise the latest techniques used in oncoplastic surgery to create an aesthetically perfect breast after treatment of breast cancer.

AESTHETIC ANATOMY OF THE BREAST

Bostwick defines the aesthetics of the breast in two senses (tactile and visual). The attractive, aesthetically pleasing breast is characterized by proper symmetry, flow, contour and proportion. Tactile aesthetic considerations are softness, smoothness, and sensitivity to touch, which is practically important in the nipple areola complex. Normal volume should range from 300g to 500g with more fullness lateral and inferior to the nipple areola complex and a 45 degree lateral inclination. Ideally, strong cutaneous and fascial support allows the parenchyma to remain above the infra mammary crease.⁽⁹⁾

Anatomy of the Breast

The breasts are conical in shape and are located, one on each side, within the subcutaneous layers of the thoracic wall, anterior to the pectoralis muscle. They extend superiorly as far as the level of the second rib, inferiorly as far as the level of the sixth or seventh ribs, laterally as far as the anterior axillary line (sometimes as far as the midaxillary line) and medially they reach the lateral margin of the sternum. Posteriorly, they make contact with the fascia of the pectoralis major, serratus anterior and external oblique muscle and the most cranial portion of the rectus abdominis muscle.⁽¹⁰⁾
