ACKNOWLEDGEMENT

First and foremost, thanks to *ALLAH*; to whom I relate any success in achieving any work in my life.

Words stand short when they come to express my gratefulness to my supervisors. I would like to express my deep thanks and extreme gratitude to *Prof. Dr. Sahar Mohamed El Fiky*, Prof. of Radiodiagnosis, Ain Shams Faculty of Medicine giving me this precious opportunity of working under her supervision. Her vast knowledge, wide experience and guidance, her utmost supreme guidance and supervision with the kindest encouragement. added much to this work.

Last but not least, my deep appreciation is expressed to my father, my mother, my husband and all members of my family for their co-operation and encouragement. And to all the staff of Radiodiagnosis department, Faculty of Medicine, Ain Shams University.

LIST OF FIGURE

<i>Figure No.:</i>	<i>Page No.:</i>
1.1. Different parts of the uterus and the uterine tube.....	4
1.2. Different parts of the cervix.....	5
1.3. Relations and peritoneal coverings of the uterine cervix.....	7
1.4. Cardinal (Transverse cervical) ligaments.....	10
1.5. Ligaments support of the cervix as seen from below.....	10
1.6. Ligaments support of the cervix lateral view.....	11
1.7. Arterial supply of the uterine cervix.....	12
1.8. Arterial supply and venous drainage of the uterine cervix.....	12
1.9. Lymph glands draining the cervix.....	15
1.10. (a):T1-weighted images of the cervix uteri.....	20
1.10. (b) T2-weighted images of the cervix uteri.....	21
1.11.T2-weighted TSE image detect the endocervical mucosa.....	21
1.12. Normal uterus. Helical CT of the normal uterus and adnexa.....	23
1.13. CT of the female pelvis before and after CM.....	23
2.1. Age standardized death from cervical cancer per 100,000 inhabitants in 2004	25
2.2 Changes in (CIN) with histologic correlates.....	28
2.3. Exopytic squamous cell carcinoma of the cervix.....	30
2.4. fungating squamous cell carcinoma of the cervix.....	30
2.5. Ulcerative squamous cell carcinoma of the cervix.....	31
2.6. Infiltrative squamous cell carcinoma of the cervix.....	31
2.7. Barrel shapped endo cervix.....	32
2.8. Well differentiated keratinizing SCC.....	33

2.9.	Large cell non-keratinizing SCC.....	33
2.10.	A large cervical squamous cell carcinoma spread to the vagina.....	41
2.11.	Pelvic exenteration for cervical SCC.....	42
2.12.	Pelvic exenteration for stage IV cervical carcinoma.....	42
3.1.	Angulation. T2W TSE pelvic MRI images in sagittal orientation.....	52
3.2.	Illustration of MR imaging protocol in sagittal and transverse orientation.....	57
3.3.	Pelvic CT scan obtained 70 s after intravenous contrast medium administration.....	64
4.1.	Stage IB1 cervical cancer (a) Sagittal and (b) coronal oblique T2-weighted images.....	69
4.2.	Stage IB2 cervical cancer.(a) Sagittal (b) Coronal oblique T2- weighted image.....	69
4.3.	Stage IIA cervical cancer. (a,b) T2w images in sagittal and transverse orientation.....	72
4.4.	Stage IIB cervical cancer.a, b T2w TSE images in sagittal and transverse orientation.....	73
4.5. (A).	Stage IIIA cervical cancer. SagittalT2-weighted image.....	74
4.5. (B).	Stage IIIB cervical cancer. T2w in transversal orientation.....	74
4.6.	Stage IVA cervical cancer.(A) Sagittal,(B) right parasagittal T2-weighted images.....	76
4.7.	Stage IVA cervical cancer. Axial oblique T2-weighted images.....	76
4.8.	Stage IVB cervical cancer. (A) Axial oblique T2-weighted image (B) Axial contrast-enhanced computed tomography.....	77
4.9a–c.	Lymph node staging in different patients. a–c PD-TSE images in transverse orientation.....	79
4.10.	Stage IIB cervical cancer. Axial oblique (A) T2-weighted, (B) DWI and (C) ADC images.	82

4.11. Pelvic sidewall recurrence following chemo radiation for cervical cancer. Axial oblique T2-weighted image.....	83
4.12. Central recurrence within the cervix following chemoradiation for cervical cancer. (A) Sagittal and (B) axial oblique T2-weighted images..	84
4.13. Cervical cancer, CT. Axial CT images (A–C).....	88
4.14. Clinical and imaging stage IIIB cervical cancer .Axial CT images of the pelvis were obtained with intravenous contrast material.....	89
4.15. Tumor extension into the uterus with initial clinical stage IB cervical cancer. Axial CT image of the pelvis.....	91
4.16 Tumor extension into the vagina with clinical stage IIIB and imaging stage IIIA cervical cancer. Axial (a), sagittal (b), and coronal (c) CT images of the pelvis.....	92
4.17. Axial CT image, Ureteral obstruction secondary to adenopathy with clinical stage IIB cervical cancer.....	95
4.18(a). Parametrial soft-tissue mass with clinical stage IIIB and imaging stage IIB cervical cancer. Axial spiral CT images of the pelvis.....	96
4.18(b) Parametrial soft-tissue mass with clinical stage IIIB and imaging stage IIB cervical cancer. Axial spiral CT images of the pelvis.....	96
4.19. Invasion of the bladder and ureteral encasement with initial clinical stage IB cervical cancer with local progression. Axial CT image of the pelvis.....	97
4.20. Invasion of the rectum and bladder with clinical and imaging stage IVA cervical cancer arising from a cervical stump after supracervical hysterectomy. Axial CT image of the pelvis.....	98
4.21. Lymphatic spread along the lateral pelvic nodal pathway with recurrent cervical cancer (clinical stage unknown) 14 years after a hysterectomy. Axial	

CT images of the pelvis were obtained with intravenous contrast material.	101
4.22. Lymphatic spread along the hypogastric pelvic nodal pathway with clinical stage IVA cervical cancer. Axial CT images of the pelvis were obtained with oral and intravenous contrast material.....	102
4.23. Lymphatic spread along the presacral pelvic nodal pathway in cervical cancer (clinical stage unknown). Axial CT image of the pelvis.....	103
4.24. Local recurrence clinical stage IB cervical cancer diagnosed 12 years earlier and treated with hysterectomy. Axial CT images of the pelvis....	104
4.25. Distant metastases. a, b Contrast-enhanced CT images. Numerous hypovascularized metastases are seen in the liver.....	107
4.26: a, b Comparison CT and MRI in diagnosis of cervical tumor . (a) sagittal reconstruction of a CT scan.(b)T2W sagittal MRI.....	109

LIST OF ABBREVIATIONS

ADC	Apparent diffusion coefficient
CIN	Cervical intraepithelial neoplasia
CIS	Carcinoma in situ
CM	Contrast media
CT	Computed tomography
3D	Three dimension
DWI	diffusion weighted image
FDG PET	Fluorodeoxyglucose Positron emission tomography
FIGO	International Federation of Gynecology and Obstetrics
FOV	Field of view
FS	Fat saturation
FSE	Fast spin echo
Gd-DTPA	Gadopentetate dimeglumine
HPV	Human papilloma virus (HPV) virus
HSIL or HGSIL	High-grade squamous intraepithelial lesion
IUCD	Intrauterine contraceptive device
LSIL or LGSIL	Low-grade squamous intraepithelial lesion
MRI	Magnetic resonance imaging
PAP	Papanicolaou test
PD	Proton density
PET	Positron emission tomography
ROI	Region-of-interest

SCC	Squamous cell carcinoma
SCJ	Squamocolumnar junction
SE	Spin echo
SNR	Signal to noise ratio
T1W	T1 weighted MR image
T2W	T2 weighted MR image
TE	Time of echo
TI	Time inversion
TNM	Classification of malignant tumours
	T Size or direct extent of the primary tumor
	N Degree of spread to regional lymph nodes
	M Presence of metastasis
TR	Time of recovery
TRUS	Transrectal ultrasound
TSE	Turbo spin echo
TZ	Transformation (transition) zone
UICC	United International Cancer Congress
US	Ultrasound

INTRODUCTION AND AIM OF THE WORK

Invasive cervical cancer is the third most common gynecologic malignancy. Its prognosis is based on the stage, size, and histological grade of the primary tumor and the status of the lymph nodes. Accurate cervical cancer staging is crucial for appropriate treatment selection and treatment planning (*Jemal et al, 2005*).

Cervical cancer is the only gynecologic cancer still clinically staged based on clinical federation of international of Gynecologists and obstetricians criteria .These include findings from physical examination, colposcopy, lesion biopsy, radiologic studies (eg, chest radiography, intravenous urography, and barium enema), and endoscopic studies (eg, cystoscopy, sigmoidoscopy) (*Pecorelli et al, 2003*).

The greatest difficulties in the clinical evaluation of patients with cervical cancer is the estimation of tumor size, especially if the tumor is primarily endocervical in location; the assessment of parametrial and pelvic sidewall invasion; and the evaluation of lymph node and distant metastases (*Bipat et al, 2003*).

Modern cross-sectional imaging CT or MR imaging examination providing evaluation of all morphologic cervical cancer prognostic factors (including tumor size, parametrial

invasion, adjacent organ/tissue invasion, and lymph node metastasis) (*Bipat et al, 2003*).

CT scanning and MRI are more accurate staging modalities than US. the tumor spread because of the inability of this technique to adequately depict all the potential sites of metastasis or the anatomic regions that contain lymph nodes (*Hricak et al, 2007*).

MRI is significantly more valuable than CT in the assessment of the size of the tumor, the depth of the cervical invasion, and the locoregional extent of the disease (direct invasion of the parametrium, pelvic sidewall, bladder, or rectum) (*Nicolet et al, 2000*).

Despite the advantages of MRI, CT scanning and MRI are not warranted in patients with small-volume early disease (stage Ib disease and a cervical tumor diameter < 2.0 cm) because of the low probability of parametrial invasion and nodal metastasis (*Mitchell et al, 2009*).

The aim of this work is to compare between M.R.I and C.T in evaluation of all pre-operative staging of cancer cervix, local, nodal ,distant metastasis, recurrence , response to therapy.
