ACKNOWLEDGMENT

First of all, thanks to **ALLAH** for everything. I present my deep thanks and invocations to greater “**ALLAH**” for his blessed assistance as to the completion of this work.

My sincere thanks and deep gratitude are to **Prof. Dr . Abd El- Halim A. .Saad**, professor of Aquatic Ecology, Department of Zoology, Faculty of Science, Ain Shams University for his supervision, valuable guidance, continuous encouragement, reviewing the manuscript and providing useful comments and suggestions for presentation of the work.

Deep thanks and gratitude are extended to **Prof. Dr .Ahmed S. Abdel-Gawad**, professor of Fish Production, head of Fish Biology and Ecology department, Central Laboratory for Aquaculture Research (CLAR) ,Abbassa ,Abo-Hammad ,Sharkia, for his supervision, proposing this research, his scientific support, facilitate any obstacle ,reviewing the manuscript and his continuous advice.

Many thanks are to **Dr. Gamal El-Azazy**, Assistant Prof. of Fish Economic, the manager of Abbassa fish production farm, **Dr. Neima Abdel-Fattah**, **Dr. Mona Hamed** and **Amany Ahmed**, Central Laboratory for Aquaculture Research (CLAR) ,Abbassa ,Abo-Hammad ,Sharkia, for their great assistance.

I wish to express my sincere gratitude to **Eng.Mohamed El-Nagar** the manager of El-Khashaa fish farm, General Authority for Fish Resources Development (GAFRD), for his valuable support throughout the carrying out of this work.

Finally, I would like to express my deepest thanks to my husband, my father, my mother and my daughters Nada and Shaza for their help and encouragement, and also every one helped me to complete this work in the final form.

ABSTRACT

Monitoring of water quality is very important, where it is the main factor affecting the cultured fish. So, the present study investigated the quality of drainage water sources and their impacts on the quality of water and fish reared in two different farms at Al-khashaa, kafr El-Sheikh governorate and at Abbassa, Sharkia governorate, Egypt. Water and fish samples were taken monthly during 2011 fish farming season, to evaluate the physico-chemical and biological characteristics and heavy metals distribution in water and fish organs (muscles ,gills and liver).

The obtained results indicated significant difference between the water of two farms, particularly in their physical and chemical characteristic (water temperature, transparency, pH, DO, NH_3 , NO_2 , NO_3 , total alkalinity, total hardness and phosphate). The levels of most parameters increased in ponds and outlet, but decreased at the inlet (drains). Heavy metals varied depending upon the organ, location and the month of sampling. Also, the order of occurrence of heavy metals in water ranked at the following order, $\text{Fe} > \text{Zn} > \text{Cu} > \text{Cd} > \text{Pb}$ at Al-Khashaa farm, but at Abbassa farm it was $\text{Fe} > \text{Zn} > \text{Cu} > \text{Pb} > \text{Cd}$, while they were found in muscles and gills as $\text{Zn} > \text{Fe} > \text{Cu} > \text{Pb} > \text{Cd}$ at Al- Khashaa fish farm, but in muscles, gills and liver tissues at Abbassa fish farm were $\text{Fe} > \text{Zn} > \text{Cu} > \text{Pb} > \text{Cd}$. The levels of heavy metals exceeded the permissible limits according WHO (1989), in gills and liver, but in muscles did not exceed the permissible limits, except Fe. Comparison of the values of condition factor (K) and hepato-somatic index (HSI) of the two fish farms indicated that fish of Abbassa ponds was the best condition. In the present study phytoplankton was represented by four groups namely Chlorophyceae, Cyanophyceae, Bacillariophyceae and Euglenophyceae,

where Chlorophyceae dominated over other groups of phytoplankton. Zooplankton was found in four groups Rotifera, Copepoda, Ostracoda and Cladocera. Rotifera and Cladocera were the dominant groups over other groups. Results indicated that the drainage water has a great effect on physical, chemical and biological characteristics of fish farms. Also, the fish farms effluents effect on the surrounding water.
