٢٠٠٧

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

اقْرَأْ بِاسْمِ رَبِّكَ الَّذِي خَلَقَ ﴿١﴾ خَلَقَ  
الْإِنْسَانَ مِنْ عَلَقٍ ﴿٢﴾ اقْرَأْ وَرَبُّكَ الْأَكْرَمُ  
﴿٣﴾ الَّذِي عَلَّمَ بِالْقَلَمِ ﴿٤﴾ عَلَّمَ الْإِنْسَانَ  
مَا لَمْ يَعْلَمْ ﴿٥﴾

صدق الله العظيم

(العلق: ١ الى ٥)

# **ACKNOWLEDGEMENT**

THANKS ARE ALL TO **GOD**, THE BENEFICENT AND THE MERCIFUL, FOR BLESSING ME THIS WORK UNTIL IT REACHED ITS END, AS A LITTLE PART OF HIS GENEROUS HELP THROUGHOUT MY ENTIRE LIFE.

I WOULD LIKE TO EXPRESS MY DEEPEST GRATITUDE TO **PROF. DR. AHMED ABD EL-KADER SAYED SHISH**, PROFESSOR OF ANESTHESIA AND INTENSIVE CARE, FACULTY OF MEDICINE, AIN SHAMS UNIVERSITY, FOR HIS SUPPORT, GUIDANCE AND ENCOURAGEMENT.

IT HAS BEEN AN HONOUR WORKING UNDER THE SUPERVISION OF **PROF. DR. SHERIF SAYED ALI SULTAN**, ASSISTANT PROFESSOR OF ANESTHESIA AND INTENSIVE CARE, FACULTY OF MEDICINE, AIN SHAMS UNIVERSITY, WHO HELPED ME IN EVERY WAY HE COULD.

I'M GREATLY INDEBTED TO LECTURER **DR. HESHAM MOHAMED EL-AZAZZI**, ASSISTANT PROFESSOR OF ANESTHESIA AND INTENSIVE CARE, FACULTY OF MEDICINE, AIN SHAMS UNIVERSITY, WHO PROVIDED ME WITH SUPPORT FROM THE VERY BEGINNING OF THIS WORK.

**MOSTAFA KAMAL**

## **List of Abbreviations**

ACL: anterior cruciate ligament

CPNBs: Continuous peripheral nerve blocks

FNB: femoral nerve block

HRUS: High-resolution ultrasound

LFC: lateral femoral cutaneous nerve

NMDA: N-methyl D-aspartate

ONB: Obturator nerve block

ORIF: open reduction and internal fixation

PABA: para-aminobenzoic acid

PCA: patient-controlled analgesia bolus

PCA-BI: patient-controlled analgesia plus background continuous infusion

PCB: Psoas compartment block

PNB: peripheral nerve block

PSNB: The parasacral nerve block

SNB: sciatic nerve block

THA: total hip arthroplasty

TKA: total knee arthroplasty

---

# **INTRODUCTION**

Regional Anesthesia is the application of a local anesthetic agent to a part of the nerve causing block of the nerve impulses to the part innervated. This interruption may be sensory or motor or both. Medical application requires that no damage occurs to the tissue and that the nerve block is reversible. Such method may be used either to relieve postoperative pain or the management of painful diseases.

Regional anesthesia is of great value for patients with various diseases when general anesthesia may be risky to the patients e.g. hypertension, coronary artery disease, arrhythmia, decompensated heart disease, cerebrovascular accidents, respiratory disease whether acute or chronic, renal and liver impairment (*Jankowski et al, ۲۰۰۳*).

So regional anesthesia is the best choice for any surgical risk patient and also when patient's cooperation is needed.

Over the past decade, several developments have led to an increased interest in lower extremity peripheral nerve block including: transient neurological symptoms associated with spinal anesthesia, also increased incidence of epidural hematoma specially with the introduction of new antithromboembolic prophylaxis regimens, and evidence of improved rehabilitation

---

outcome with continuous lower extremity peripheral nerve blocks and because of the increased interest several developments in the lower extremity peripheral nerve block techniques led to easier performance and better outcome (*Iskander et al, ۲۰۰۳*).

Before discussing lower extremity peripheral nerve blocks it is pertinent to review physiology of nerve conduction and to discuss the pharmacology of local anesthetic drugs used commonly to perform these blocks (*Strichartz and Berde, ۲۰۰۵*).

## Anatomy of the lumbar plexus

The lumbar and sacral plexuses innervate the lower limb. The lumbar plexus lies deep within psoas major anterior to the transverse processes of the first three lumbar vertebrae. The sacral plexus lies in the pelvis on the anterior surface of the piriformis deep to the pelvic fascia, which separates it from the inferior gluteal and pudendal vessels. The lumbosacral trunk (L<sup>4</sup>-L<sup>5</sup>) emerges medial to psoas major and lies on the ala of the sacrum before crossing the pelvic brim to join the anterior primary ramus of S<sup>1</sup> (*Bannister et al, 1999*).

### Lumbar plexus

Location: *figure 1* The lumbar plexus lies within the substance of the psoas major (at the junction of the posterior third and the anterior two thirds of the muscle), and anterior to the transverse processes of the lumbar vertebrae.

Origin: lumbar plexus is formed by the first three, and most of the fourth lumbar vertebrae rami. The first lumbar ramus receives a branch from last thoracic ventral ramus (*Mays, 1991*).

---

The most common arrangement of the plexus:

The first lumbar ventral ramus joined by a branch from the twelfth thoracic ventral ramus, bifurcates into:

1) The upper and larger part which divides again into iliohypogastric and ilioinguinal nerves.

2) The smaller lower part which unites with a branch from second lumbar ventral ramus to form genitofemoral nerve.

The remainder of the second, third and part of the fourth lumbar ventral rami join the plexus and divide into ventral and dorsal branches. Ventral branches join to form the obturator nerve. The main dorsal branches join to form the femoral nerve. Small branches from the dorsal branches of the second and third rami join to form the lateral femoral cutaneous nerve (*Bogduk, 1991*)

The lumbar plexus is supplied by the lumbar vessels which supply the psoas major (*Crock, 1997*).

## The branches of lumbar plexus: figure(1)

-Muscular	T <sup>12</sup> , L <sup>1-4</sup>
-Iliohypogastric	L <sup>1</sup>
-Ilioinguinal	L <sup>1</sup>
-Genitofemoral	L <sup>1</sup> , L <sup>2</sup>
-Lateral femoral cutaneous	L <sup>2</sup> , L <sup>3</sup>
-Femoral	L <sup>2</sup> - L <sup>4</sup> dorsal divisions
-Obturator	L <sup>2</sup> - L <sup>4</sup> ventral divisions
-Accessory obturator	L <sup>2</sup> , L <sup>3</sup>

*figure(1):* Branches of lumbosacral plexus (*Bannister et al, 2005*).

---

## 1) Muscular branches:

They are small branches from all five lumbar roots.

## 2) Iliohypogastric nerve:

Distribution: The Iliohypogastric nerve originates from the L<sup>1</sup> ventral ramus. It emerges from the upper lateral border of Psoas major, crosses obliquely behind the lower renal pole in front of Quadratus lumborum above the iliac crest. It enters the posterior part of transversus abdominis and internal oblique. The iliohypogastric nerve is connected to with the subcostal and ilioinguinal nerves (*Burkillhand and Healy, 1966*).

It divides into lateral and anterior cutaneous branches and also supplies both muscles.

The lateral cutaneous branch runs through internal and external oblique above iliac crest, a little behind the iliac branch of twelfth thoracic nerve and is distributed to the posterolateral gluteal skin.

The anterior cutaneous branch runs between and supplies internal oblique and transversus abdominis. It runs through internal oblique 2 cm medial to anterior superior iliac spine, and through external oblique aponeurosis 2 cm above

---

superficial inguinal ring and is then distributed to suprapubic skin (*Mays, 1991*).

It is occasionally injured during an oblique surgical approach to the appendix. However because the suprapubic skin is innervated from several sources there is rarely any detectable sensory loss. Division of the iliohypogastric nerve above superior iliac spine weakens posterior wall of the inguinal canal and predispose to direct inguinal hernia (*Burkillhand and Healy, 2000*).

### Motor:

The iliohypogastric nerve supplies a small motor contribution to transversus abdominis and internal oblique including the conjoint tendon.

### Sensory:

The Iliohypogastric nerve supplies sensory fibers to transversus abdominis, internal oblique and external oblique and innervate the posterolateral gluteal and suprapubic skin (*Crock, 1997*).

---

### ۳) Ilioinguinal nerve:

Distribution : the ilioinguinal nerve originate from ventral ramus of L<sup>۱</sup> , it is smaller than the iliohypogastric nerve and arises with it from the first lumbar ventral ramus , to emerge from the lateral border of psoas major with or just inferior to iliohypogastric nerve, It passes obliquely across the quadratus lumborum and the upper part of iliacus and enters transversus abdominis near the anterior end of iliac crest, it sometimes connected to iliohypogastric nerve at this point (*Newell, ۱۹۹۷*).

It pierces internal oblique and supplies it and then transverses the inguinal canal below the spermatic cord, it emerges with the cord from the superficial inguinal ring to supply the proximal medial skin of the thigh and skin over the root of the penis and upper part of scrotum in males or the skin covering the mons pubis and the adjoining labium majus in females (*Bannister et al, ۲۰۰۵*).

The nerve may be injured during hernia operation leading to paraesthesia over the skin of genitalia.

#### Motor:

It Supplies the transversus abdominis and internal oblique.
