ACKNOWLEDGEMENT

First of all, thanks to Allah for helping me to achieve this work.

I wish to express my greatest appreciation to Prof. Dr. Ahmed Hany Weshahy, Professor of Dermatology, Faculty of Medicine, Cairo University, for his continuous interest, encouragement and great care. He has generously offered me much of his time, precious advice and valuable guidance throughout this work.

I am indebted to Dr. Shahira Ramadan, Lecturer of Dermatology, Faculty of Medicine, Cairo University, for her close supervision, tremendous effort and continuous valuable advice throughout this work. I truly appreciate her patience in answering all my questions.

I would like to acknowledge all my professors and all the staff members of Dermatology Department, Cairo University for their kindness, help and friendly attitude.

Finally, a very warm thanks goes to my family, who tolerated me through all stages of this work.

ABSTRACT

This work is done to present a detailed study of the recent advances in rosacea. Rosacea is characterized by a background of erythema and telangiectasia which may be superimposed by inflammatory episodes of papules, pustules and swellings. In the course of typical rosacea, special variants may occur mainly, the granulomatous form, the disseminated form and the steroid induced variety. Eye complications are common to occur in rosacea patients, these are either benign, in the form of conjunctivitis, blepharitis and chalazia or serious, threatening vision in the form of rosacea keratitis. Rhinophyma may present either as one stage of rosacea or it may be the only manifestation of the disease. The treatment of choice for all stages and complications of rosacea is oral tetracycline.

KEY WORDS:

Rosacea – Rhinophyma – Telangiectasia – Erythema.
