## **Acknowledgment**

First of all, thanks to *Allah* the most merciful for guiding me through and giving me strength to complete this work the way it is.

It is a pleasure to express my deepest thanks and profound respect to my honored professor, ***Professor Dr. Safaa Shafik Emam***, professor of pediatrics, Faculty of Medicine, Ain Shams University, for her continuous encouragement and valuable supervision and guidance throughout this work. It has been an honor and a privilege to work under her generous supervision.

Also, I wish to express my deep gratitude to ***Dr. Ghada Ibrahim Gad***, lecturer of pediatrics, Faculty of Medicine, Ain Shams University, for her kind support, help, careful supervision and her continuous guidance.

I am also deeply grateful and would like to express my sincere thanks and gratitude to ***Dr. Shereen Hassan Atief***, lecturer of clinical and chemical pathology, Faculty of Medicine, Ain Shams University, for her great help and support.

No words could adequately express my deep appreciation to my family, especially my parents, my brothers and my wife for their continuous support and guidance. I shall remain indebted to them all my life.

Special thanks to my patients, wishing them a happy and healthy life.

# **Introduction & Aim of work**

---

## **INTRODUCTION**

Hypoxic–ischemic encephalopathy (HIE) is an important cause of death and disability in full-term infants. The incidence of moderate or severe hypoxic–ischemic encephalopathy has remained essentially unchanged over the past 20 years, at 1.5 to 2 per 1000 live births in the United States. Approximately 10 to 20 percent of these infants will die, and 20 to 30 percent of those who survive will be disabled (*Dixon et al*, 2002).

In term neonates, 90% of asphyxial insults occur in the antepartum or intrapartum periods as a result of placental insufficiency, resulting in an inability to provide oxygen (O<sub>2</sub>) to and remove carbon dioxide (CO<sub>2</sub>) and hydrogen ion (H<sup>+</sup>) from the fetus. The remainders are postpartum, usually secondary to pulmonary, cardiovascular, or neurologic abnormalities (*Aurora & Snyder*, 2004).

Mild encephalopathy carries a good prognosis, although in moderate and severe encephalopathy the risk of death or neurologic sequelae increases greatly (*Finer et al*, 1999).

Neuroprotective interventions are increasingly in the forefront of interest and have been shown to be effective in animal models. For clinical intervention, it is important to identify infants at a high risk for brain damage soon after birth and within the therapeutic window (*Vannucci et al*, 1999).

Neurotrophic factors play crucial roles in neuroprotection; neurotrophins promote survival and can reduce apoptosis in many populations of neurons (*Hetman et al*, 2000). Nerve growth factor, brain derived neurotrophic factor (BDNF), and neurotrophin 3 (NT3) are neurotrophins that act on tyrosine kinase (Trk) A, Trk B, activities, neurotrophins play important roles in axon growth during development (*Tucker et al*, 2001), higher neuronal

---

functions (*Chao, ٢٠٠٠*), morphologic differentiation, and neurotransmitter expression (*Takei et al, ١٩٩٨*).

Thus, neurotrophins may play important role in antenatal and postnatal brain development (*Korhonen et al, ١٩٩٨*).

In addition, BDNF has been demonstrated to decrease tissue loss in brain when administered after hypoxic-ischemic injury in neonatal animals (*Cheng et al, ١٩٩٧*), (*Ferrer et al, ٢٠٠١*).

Circulating BDNF levels correlate with cortical BDNF levels in newborn rats (*Karege et al, ٢٠٠٢*).

Thus, questions remain concerning the presence and significance of neurotrophins during the perinatal period and especially in relation to factors that may cause neurologic insults in the developing brain. Proposed initial steps to address these questions involve analyzing neurotrophin levels in umbilical cord blood in newborns with perinatal hypoxia.

### **Aim of the work**

The aim of the present work is To assess cord blood BDNF level in full term newborns with perinatal asphyxia, to follow up its level during reperfusion phase and to study its possible relation to the development and severity of HIE .
