STUDIES ON WHEAT FROZEN DOUGHS

BY
EL SAYED ATTIA AHMED ABD-ELHADY

B.Sc. Food Science and Technology, Zagazig University, 1981
M.Sc. Food Technology, Suez Canal University, 1987

A THESIS
Submitted in Partial Fulfilment of the Requirements
For the Degree of
Doctor of Philosophy

In
Agricultural Science
(Food Technology)

To
Food Science and Technology Department
Faculty of Agriculture
Suez Canal University
(1993)

SUPERVISED BY

Prof. Dr. Salah K. El-Samahy,
Suez Canal University

S.K. EL Samahy

Prof. Dr. Magdy G. Abd El-Fadeel,
Suez Canal University

M.G. Abd El-Fadeel

Prof. Dr. Said S. Ibrahim,

ACKNOWLEDGEMENT

The author wishes to express special thanks and deep appreciation to Professor Dr. W. Seibel, Director and Chairman of Institute for Milling and Baking Technology, Federal Centre for Cereal, Potato and Lipid Research, Detmold, Germany, for his helpful supervision and valuable suggestions and facilities during the whole period of work.

Infinite thanks and appreciation are also due to professor Dr. S.K. El-Samahy, Professor of Food Science and Technology Department, Faculty of Agriculture, Suez Canal University, for his sincere, continuous supervision, fruitful guidance and his giving every possible advice throughout the course of this investigation.

Many thanks are also due to Professor Dr. S.S. Ibrahim, professor of Food Science and Technology Department, Faculty of Agriculture, Suez Canal University, for his kindness and supervision throughout this work.

I wish to express my thanks to Professor Dr. M.G. Abd El-Fadeel, professor of Food Technology and Vice Dean, Faculty of Environmental Agricultural Sciences, Suez Canal University, for the valuable criticism and supervision throughout this work.

Special thanks are to Professor Dr. J.M. Brümmer, Vice-Director and professor in the Institute for Milling and Baking Technology, Detmold, Germany, for his kind help and encouragement during this work.

Appreciation is extended to the members of the Institute for Milling and Baking Technology in Detmold, especially Dr. D. Meyer, Dr. Röcken and Mr. K. Münzing for their valuable and continuous help.

Deep thanks are also due to all staff members of Food Science and Technology Department, Faculty of Agriculture, Suez Canal University.

Special thanks are to the Egyptian Government for offering the scholarship and for the continuous help during this work.

RESULTS AND DISCUSSION57

Part I: Freezing, storage and thawing of frozen bread dough... 57

1. Effect of freezing conditions on the freezing rate,
viability of yeast, yeast activity, extensograph
properties and white pan bread quality..... 57
2. Effect of thawing and proofing conditions on white pan
bread quality..... 82
3. Changes occurring in the dough during freezing time..... 88
4. Effect of frozen storage and freeze-thaw cycles on the
viability of yeast, yeast activity, rheological behaviour
and white pan bread quality..... 95

Part II : Optimization of frozen bread dough ingredients..... 111

1. Effect of ingredients on frozen bread dough stability..... 111
2. Effect of some additive and storage time on the
ultrastructure of frozen bread dough and the quality
of the produced bread..... 141
3. The freezable water in the dough..... 163

SUMMARY AND CONCLUSIONS166

LITERATURE CITED173

ARABIC SUMMARY

INTRODUCTION

INTRODUCTION

In the late 1950 an entrepreneur from outside the baking industry had the idea of producing frozen dough to be marketed at the retail level to the housewife. The idea was to offer a completely mixed, yeast-leavened dough in frozen form letting the homemaker bake "homemade" bread in her own kitchen without the mess and fuss of ingredient preparation and mixing (Spooner, 1990).

The economic factors that make frozen dough bread to be cheaper can be summarized in the following: (a) the complete bakery requires a greater number of skilled personnel than bake - off bakery, (b) the installation of a bake - off operation costs only one fifth that of a complete bakery, (c) the bake-off bakery requires much less space than the complete bakery., (d) the product is not delivered daily but goes out through normal frozen food distribution channels and can be stored until needed, (e) bake - off offers a flexibility to bake as much or as little as needed, and (f) there is no spoilage or "stales" in frozen dough. (Lorenz, 1974; Watson, 1974; and Vetter, 1979).

Frozen dough is now a very important item in baking technology. For the first time the classical system of bread and roll baking (mixing, fermentation, baking) can be interrupted at different stages, e.g., after mixing, after 3/4 proof time.

Freezing of prebaked and baked products, e.g., bread in Norway or rolls in Germany, have been already practiced since many years.

Especially with wheat bread and rolls, the problem of staling still exists, because the time difference between the production and consumption is too long. White bread stales after 2 days and with hard wheat rolls the crust softens after 4-6 hours, depending on the relative humidity of the air. Another advantage of dough freezing is that skilled bakers are no more needed for the baking process. Depending on the type of frozen dough, the thawing, fermentation (if necessary) and baking can be practiced in every hotel kitchen. With wheat rolls (dough pieces up to 75g and prefermented $\frac{3}{4}$ of fermentation time) it is now possible to put the frozen dough pieces directly in the oven, thaw them by several steam injections in the oven and bake them in the same baking oven. The total time for thawing and baking is about 25 minutes. Till now, there is practically no frozen dough in African and East European countries. In Western Europe, there is an increasing market for frozen dough, especially with small dough pieces (<100g). In Germany and France, several factories are producing only frozen dough in large varieties, which are sold to the bakeries, hotels or hospitals. The frozen dough pieces are used for the bake-off system. In doing so, there are always fresh baked products, the basis for increasing the bread and roll consumption. Also in Great Britain, the market for frozen dough is increasing (Seibel, 1993).

Frozen dough business started, however, in the United States of America (Van der Plaat, 1988 and Seibel, 1993). There exists the greatest experience in preparing and also marketing of frozen dough, including dough pieces greater than 100 g.

The importance of frozen dough undoubtedly will further increase. Frozen doughs will come to countries, where they are unknown today. Frozen dough systems should not be copied from one country to another like recipes. Every country has to develop its own system, based on the local circumstances, the different bread and roll varieties and the marketing systems (Seibel, 1993).

Thus, the present work aimed at studying the following points:

1. Effect of freezing conditions on the freezing time, viability of yeast, yeast activity, extensograph properties and white pan bread quality.
2. Effect of thawing conditions on the quality of white pan bread.
3. Changes occurring to the dough during freezing time.
4. Effect of frozen storage time and freeze-thaw cycles on frozen bread doughs stability.
5. Optimization of the frozen bread doughs ingredients.
6. The ultrastructure of frozen bread doughs.
