A Thesis

Submitted in Partial Fulfillment for Requirement of the Degree of the
Master of Science in Structural Engineering

Approved by

Prof. Dr. Amr Ali Abd Al Rahman

Prof. Dr. Tarek Kamal Hassan

Statement

This thesis is submitted to Ain Shams University, Cairo, Egypt, on March 2013 for the degree of Master of Science in Civil Engineering (Structural).

No part of this thesis has been submitted for a degree or qualification at any other University or Institute.

Date : 20 /03 / 2013

Name : Mohamed Omar El Sawy

Signature :

Information about the Researcher

Name : Mohamed Omar El Sawy Mohamed

Date of Birth : January 18th, 1978

Place of Birth : Cairo, Egypt

Qualifications : B.Sc. Degree in Civil Engineering (Structural Eng.)
Faculty of Engineering, Ain Shams University (2000)

Present Job : Senior Structural Engineer, Dar Al-Handasah
Consultants, Cairo, Egypt.

Signature :

Acknowledgement

I would like to thank God, without Him, nothing would be possible.

I would like to thank my parents, my brother Yasser Omar El Sawy for their unwavering support and love.

I would like to thank Prof. Dr. Amr Abd Al Rahman Ali and Prof. Dr. Tarek Kamal Hassan for their valuable guidance throughout the years; it is greatly appreciated and will never be forgotten.

I would like to thank **CEMEX READY MIX (Egypt)** for the sponsored supply of concrete mixes and concrete patches. Special thanks are extended to the technicians at the Structural Laboratory of Ain Shams University for their help during the experimental program.

I would like to thank my friend Mahmoud Mounir for his steadfast encouragement and advice.

Finally, special appreciation goes to my wife, her substantial encouragement and support helped me to finalize my research. Hence, to her this thesis is dedicated.

*To my parents, whom, I
owe too much. To my wife
whom encouraged me so
much.*

BOND CHARACTERISTICS OF SELF CONSOLIDATING REINFORCED CONCRETE BEAMS

دراسة خواص التماسك في الكمرات المصنعة من الخرسانة ذاتية الدمك

The application of Self Consolidating Concrete, SCC, effectively resolves the difficulties of concreting in situations with complicated formwork and intricate reinforcements. Although, bond between SCC and reinforcing steel bars is an essential requirement for design of reinforced concrete structures, little research is available up to date on this topic. This study is a continuation of a recent study conducted to evaluate the effect of the bar diameter, splice length and the confinement level provided by the transverse reinforcement. The current study aims at widening the available knowledge on the bond characteristics of SCC members by including other parameters that have not been studied previously. The current research focus on studying the influence of the concrete compressive strength, bar spacing and concrete cover on the bond characteristics of SCC beams. Eight reinforced concrete beams were constructed using different concrete strengths varies between 30 to 60 MPa, and tested under four point bending. The behavior of the tested specimens has been evaluated and characterized both experimentally and analytically. A finite element study has been conducted using ATENA software to ensure the experimental results, this study adopt that bond strength of SCC is less than the conventional concrete by 24%. Failure criteria due to bond has been established and applied on all the selected beams.

تم التركيز من خلال هذا البحث على دراسته تأثير كل من مقاومه الضغط للخرسانه و المسافه بين الاسياخ و الغطاء الخرساني عل مقاومه التماسك بين الخرسانه ذاتيه الدمك و اسياخ الحديد للكمرات الخرسانيه. تم تقييم سلوك الكمرات المصنعه من الخرسانه ذاتيه الدمك عمليا و تحليليا. يقدم البحث اعتبارات تصميميه واضحه لاستخدام الخرسانه ذاتيه الدمك في الكمرات الخرسانيه المسلحه. تم صب عدد 8 كمرات مستطيله المقطع و اختبارها تحت ظروف تحميل استاتيكيه و تم اختبار خرسانه ذات قيم مختلفه لمقاومه الضغط تتراوح بين (30 ميجا باسكال) الي (60 ميجا باسكال). كما تم دراسة قيم مختلفه للغطاء الخرساني للكمرات. و امتد البحث ليشمل دراسته تأثير عدد الوصلات و المسافه بين الاسياخ علي مقاومه الانزلاق للأسياخ داخل الخرسانه ذاتية الدمك. الاستقصاء التحليلي يلقي بالضوء على تقييم دقيق للنماذج المتعدده التي تمثل العلاقه بين اجهادات الربطه و الانزلاق لحديد التسليح المرتبط بالخرسانه و امكانية استخدامها في الخرسانه ذاتيه الدمك. و تم تطوير النموذج لتحديد طول الرباط المطلوب لتحقيق اجهاد الخضوع لاسياخ حديد التسليح المستخدمه مع الخرسانه ذاتيه الدمك. كما تم عمل دراسة تحليلية باستخدام طريقة العناصر الغير محددة عن طريق استخدام برنامج (ATENA) لتمثيل بعض الكمرات في هذا البحث و بحث سابق تم إجراؤه بجامعة عين شمس. و ذلك لتأكيد ما تم التوصل إليه من نتائج معملية. و قد أظهرت النتائج إثبات أن مقاومه التماسك للخرسانة ذاتية الدمك أقل بنسبة 24% من الخرسانة التقليدية. كما تم التوصل إلى معيار للإنهيار مقاومه التماسك للخرسانة تم تعميمه على جميع الكمرات موضوع هذه الدراسة.

Abstract

The application of Self Consolidating Concrete, SCC, effectively resolves the difficulties of concreting in situations with complicated formwork and intricate reinforcements. Although, bond between SCC and reinforcing steel bars is an essential requirement for design of reinforced concrete structures, little research is available up to date on this topic. This study is a continuation of a recent study conducted to evaluate the effect of the bar diameter, splice length and the confinement level provided by the transverse reinforcement. The current study aims at widening the available knowledge on the bond characteristics of SCC members by including other parameters that have not been studied previously. The current research focus on studying the influence of the concrete compressive strength, bar spacing and concrete cover on the bond characteristics of SCC beams. The behavior of the tested specimens has been evaluated and characterized both experimentally and analytically. A finite element study conducted using ATENA software to ensure the experimental results, this study adopt that bond strength of SCC is less than the conventional concrete by 24%. Failure criteria due to bond has been established and applied on all the selected beams.
